Plot

Description

Biotype detection	Number of genes per biotype in the genome, and detected (counts > 0) in the sample/condition.
Biotype expression	Distribution of gene counts per million per biotype in sample/condition (only genes with counts > 0).
Saturation	Number of detected genes (counts > 0) per sample across different sequencing depths
Expression boxplot	Distribution of gene counts per million (all biotypes) in each sample/condition
Expression barplot	Percentage of genes with >0, >1, >2, >5 or >10 counts per million in each sample/condition.
Length bias	Mean gene expression per each length bin. Fitted curve and diagnostic test.
GC content bias	Mean gene expression per each GC content bin. Fitted curve and diagnostic test.
RNA composition bias	Density plots of log fold changes (M) between pairs of samples. Confidence intervals for the median of M values.

Sequencing bias detection

Diagnostic plot for feature length bias

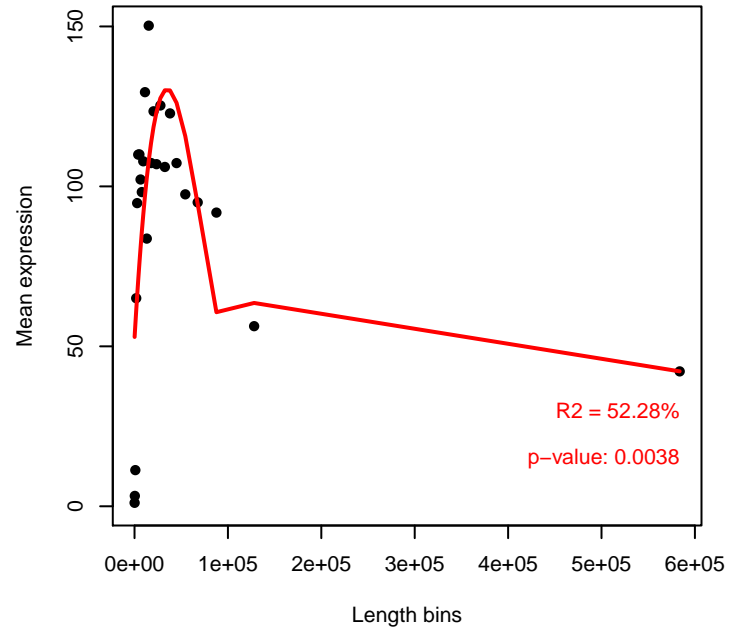

WARNING. At least one of the model p-values was lower than 0.05, but $R^2 < 70\%$ for at least one condition.

Normalization for correcting length bias could be advisable.
Please check in the plots below the strength of the relationship between length and expression.

Kidney

Liver

Diagnostic plot for GC content bias

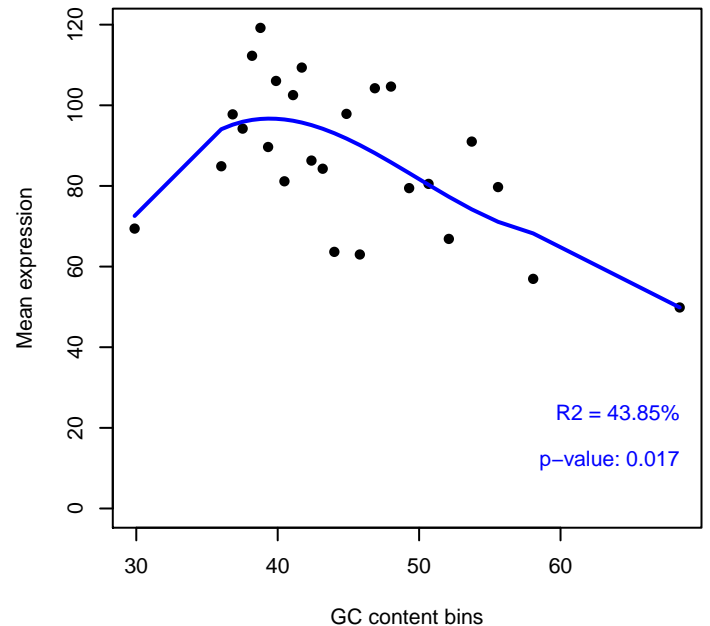

WARNING. At least one of the model p-values was lower than 0.05, but $R^2 < 70\%$ for at least one condition.

Normalization for correcting GC content bias could be advisable.
Please check in the plots below the strength of the relationship between GC content and expression.

Kidney

Liver

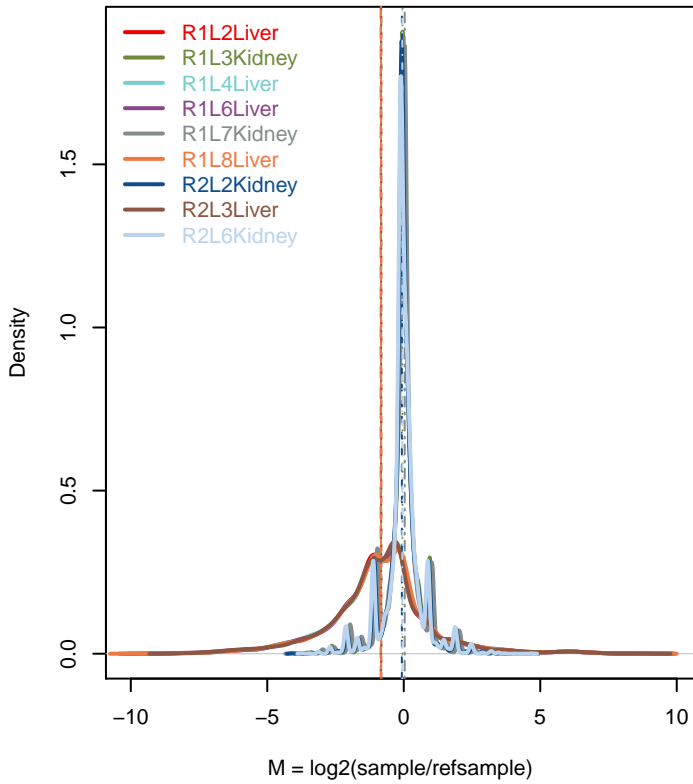

Diagnostic plot for differences in RNA composition

FAILED. There is a pair of samples with significantly different RNA composition

Normalization for correcting this bias is required.
