Index

```
image.RGList
```

Description

Function to visualize spatial distribution of raw intensities on NimbleGen Oligoarrays. Requires RGList with component genes complete with genes\$X and genes\$X coordinates of probes on array. arrayImage is a synonym of image.RGList.

Usage

Arguments

Х	object of class RGList containing red and green channel raw intensities; pos- sibly result of readNimblegen.
arrayno	integer; which array to plot; one of 1:ncol (x\$R)
channel	<pre>character; which channel to plot, either red, green or the logratio log2 (red) - log2 (green)</pre>
mycols	<pre>vector of colors to use for image; if NULL defaults to colorRampPalette(c("White", "Yellow", "Red"))(10)</pre>
mybreaks	optional numeric vector of breaks to use as argument breaks in image.default; default NULL means take length (mycols) +1 quantiles of the data as breaks.
diml	string; which column of the 'genes' element of the supplied RGList indicates the first dimension of the reporter position on the microarray surface; for exam- ple this column is called 'X' with some NimbleGen arrays and 'Row' with some Agilent arrays.
dim2	string; which column of the 'genes' element of the supplied RGList indicates the second dimension of the reporter position on the microarray surface; for example this column is called 'Y' with some NimbleGen arrays and 'Col' with some Agilent arrays.
ppch	which symbol to use for intensities; passed on as pch to points.default
pcex	enlargement factor for intensity symbols; passed on as cex to points.default
verbose	logical; extended output to STDOUT?
	further arguments passed on to plot.default and points.default

Value

invisibly returns NULL; function is called for its side effect, this is producing the plot

Joern Toedling (toedling@ebi.ac.uk)

asExprSet

See Also

readNimblegen,plot.default,points.default

Examples

```
exDir <- system.file("exData",package="Ringo")
exRG <- readNimblegen("example_targets.txt","spottypes.txt",path=exDir)
image(exRG, 1, channel="red", mycols=c("black","darkred","red"))
## this example looks strange because the example data files only
## includes the probe intensities of probes mapped to the forward
## strand of chromosome 9.
## you can see these probes are distributed all over the array
```

asExprSet converts a Ringo MAList into an ExpressionSet

Description

Function to convert an object of class MAList into an object of class ExpressionSet. Note that the otherwise optional targets component is required in this case to generate the phenoData of the new ExpressionSet.

Usage

asExprSet(from, idColumn="PROBE_ID")

Arguments

from	object of class MAList to convert into an ExpressionSet
idColumn	string; indicating which column of the genes data.frame of the MAList holds
	the identifier for reporters on the microarray. This column, after calling make.names
	on it, will make up the unique featureNames of the resulting ExpressionSet.

Value

an object of class ExpressionSet

Note

There is a more general function for converting MALists to ExpressionSets in the package convert. This function here is solely intended for converting Ringo-generated MALists into ExpressionSets.

ExpressionSet, preprocess

autocor

Examples

```
exDir <- system.file("exData",package="Ringo")
exRG <- readNimblegen("example_targets.txt","spottypes.txt",path=exDir)
exMA <- preprocess(exRG, "none", returnMAList=TRUE)
exX <- asExprSet(exMA)</pre>
```

```
autocor
```

```
Function to compute auto-correlation of probe intensities
```

Description

Function to compute auto-correlation of probe intensities at specified offsets from the original positions.

Usage

```
autocor(x, probeAnno, chrom = "1", samples = NULL, lag.max = 2000,
lag.step=100, cor.method = "pearson",
channel = c("red","green","logratio"), verbose = TRUE)
```

Arguments

х	an object either of class ExpressionSet containing the normalized probe intensities or of class RGList containing the raw intensities.
probeAnno	Object of class probeAnno holding chromosomal match positions and indices of reporters in data matrix.
chrom	character; chromosome to compute the autocorrelation for
samples	which samples of the data to use; if more than 1 for each probe the mean inten- sity over these samples is taken.
lag.max	integer; maximal offset from the original position, the auto-correlation is to be computed for.
lag.step	integer; step size of lags between 0 and maximal lag.
cor.method	character; which type of correlation to compute, translates to argument ${\tt method}$ of function ${\tt cor}$
channel	<pre>character; in case x is an RGList, which channel to plot, either red, green or the logratio log2 (red) -log2 (green)</pre>
verbose	logical; extended output to STDOUT

Details

the lags, i.e. the offsets from the original position, the auto-correlation is to be computed for, are constructed from the given arguments as seq(0, lag.max, by=lag.step).

Value

Object of class autocor.result, a numeric vector of auto-correlation values at the offsets specified in argument lags. The lag values are stored as the names of the vector. Argument chrom is stored as attribute chromosome of the result.

cherByThreshold

Examples

cherByThreshold Function to identify chers based on thresholds

Description

Given a vector of probe positions on the chromosome, a vector of smoothed intensities on these positions, and a threshold for intensities to indicated enrichment, this function identifies *Chers* (ChIP-enriched regions) on this chromosome.

This function is called by the function findChersOnSmoothed.

Usage

```
cherByThreshold(positions, scores, threshold, distCutOff,
minProbesInRow = 3)
```

Arguments

positions	numeric vector of genomic positions of probes	
scores	scores (intensities) of probes on those positions	
threshold	threshold for scores to be called a cher	
distCutOff	maximal positional distance between two probes to be part of the same cher	
minProbesInRow		
	integer; minimum number of enriched probes required for a cher; see details for further explanation.	

Details

Specifying a minimum number of probes for a cher (argument minProbesInRow) guarantees that a cher is supported by a reasonable number of measurements in probe-sparse regions. For example, if there's only one enriched probe within a certain genomic 1kb region and no other probes can been mapped to that region, this single probe does arguably not provide enough evidence for calling this genomic region enriched.

Value

A LIST with n components, where the first n components are the cher clusters, each one holding the scores and, as their names, the genomic positions of probes in that cluster.

   points(x=as.numeric(names(thisClust)), y=thisClust, type="h", lwd=2,
   col="gold")})
```

```
cher-class
```

Class "cher" - ChIP-enriched region

Description

An object of class cher (ChIP-enriched region) holds characteristics of an enriched genomic region from ChIP chip data.

Objects from the Class

```
Objects can be created by calls of the form new("cher", name, chromosome, start, end, cellType, antibody, maxLevel, score, probes, extras, ...).
```

Slots

name: character vector of length 1 unequivocally describing the cher, e.g. "Suz12.Nudt2.upstream.cher"

chromosome: character vector of length one, naming the chromosome of the region, e.g. "9"

start: integer, region start position on the chromosome, e.g. 34318900

end: integer, region end position on the chromosome, e.g. 34320100

cellType: character vector describing the cell type the ChIP chip experiment has been done on, e.g. "HeLa" or "human"

antibody: character vector describing the antibody or characteristic for which fragments were supposedly enriched in immuno-precipitation step, e.g. "Suz12" for the protein Suz12

maxLevel: numeric, maximal (smoothed) probe level in the cher, e.g. 2.00

score: numeric of a cher score, currently we use the sum of smoothed probe levels (log fold changes), e.g. 69.16

cher-class

- **probes:** character vector of probe identifiers of all probes with match positions in the cher
- **extras:** list of further elements used to annotate the cher; examples of such that are used in Ringo are:
 - **typeUpstream** optional character vector of features that this cher is located upstream of, e.g. the transcriptional start site of "ENST00000379158". See relateChers for details.
 - typeInside optional character vector of features that this cher is located inside of
 - distMid2TSS optional named numeric vector of distances of the cher's middle position to features, e.g. TSSs of features upstream and inside; names are the features to which the distances are given; only meaningful in combination with typeUpstream and typeInside; e.g. 55 with name "ENST00000379158"
 - **upSymbol** optional character vector of gene symbols of features the cher is located upstream of; supplements typeUpstream; e.g. "Nudt2"
 - **inSymbol** optional character vector of gene symbols of features the cher is located upstream of; supplements typeInside.
 - ... further list elements can be added using the update method.

Methods

initialize create a new cher; see section examples below

plot calls chipAlongChrom to plot the cher; see plot.cher for more details

- update signature(cher,...); updates elements of the cher object; The further arguments in '...' are interpreted. Arguments corresponding to defined slot names of the cher result in the value by that slot being replaced by the specified value for the argument; argument names that do not correspond to slot names of the object result in list elements of the extras list of the cher being replaced by the given values for these arguments or the values are appended to the current extras list and the argument names make up the list names of the appended arguments. See section examples below for an example how to use this method.
- **cellType** obtain or replace the description of the cell type, the ChIP-enriched regions was found in with this antibody

cherList

A list in which each element is of class cher, is called a cherList. This class, however, is rarely used (yet).

Note

The cher class used to be an S3 list before.

The term 'cher' is shorthand for 'ChIP-enriched region'. We think this term is more appropriate than the term 'peak' commonly used in ChIP-chip context. Within such regions the actual signal could show two or more actual signal peaks or none at all (long plateau).

     modColumn = "Cy5", allChr = "9", winHalfSize = 400)
plot(cherNudt2, smoothX, probeAnno=exProbeAnno, gff=exGFF, extent=5000)
```

chipAlongChrom Visualize ChIP intensities along the chromosome

Description

This function can visualize the array intensities from a ChIP chip experiment for a chromosomal region or the whole chromosome. It's loosely based on the plotAlongChrom function from the package tilingArray, but provides a different visualization.

Usage

```
chipAlongChrom(eSet, chrom, probeAnno, xlim, ylim = NULL,
samples = NULL, paletteName = "Dark2", colPal = NULL,
byStrand = FALSE, ylabel = "fold change [log]", rugCol = "#000010",
itype = "r", ipch = 20, icex = 1, ilwd = 3, ilty = 1, useGFF = TRUE,
gff = NULL, featCol = "darkblue", zero.line = TRUE, putLegend = TRUE,
add = FALSE, maxInterDistance = 200, coord=NULL, verbose = TRUE, ...)
```

Arguments

eSet	An expression set containing the (normalized) ChIP intensities. Can be gener- ated by using the function <code>asExprSet</code> .
chrom	character; the chromosome to visualize
probeAnno	Environment holding genomic position, index and gene association of probes on array. See scripts/makeProbeAnno.R for how to generate such an environment.
xlim	start and end genomic coordinates on the chromosome to visualize
ylim	<pre>minimum and maximum probe intensities for the plot, if NULL(default) set as range(exprs(eSet))</pre>

samples	numeric; which samples from the <code>eSet</code> are to be shown. Default is to show all samples in the <code>eSet</code> ,	
paletteName	character; Name of the RColorBrewer palette to use for sample colors. If the number of samples is greater than the palette size, random colors are taken.	
colPal	vector of colors to use for the sample intensities. This is alternative to the argument paletteName for specifying which colors to use.	
byStrand	logical; not implemented yet.	
ylabel	character; label for the y-axis, passed on to the plotting function as ylab	
rugCol	color to use for marking the probe positions on the x-axis (genomic coordinate)	
itype	character; type of plot type to use for the sample intensities. Can be "r","u", or any of the type specifications used in plot.default. Defaults to "r". Please refer to the details section below.	
ipch	plot character to use with itype="p"	
icex	character expansion to use for plotting symbol	
ilwd	line width of plotted lines if itype="l"	
ilty	line type of plotted lines if itype="l"; passed on to par(lty).	
useGFF	use further annotation	
gff	Data frame containing annotation for genomic feature to be used to further an- notate the plot.	
featCol	color to use for genomic features.	
zero.line	logical; should a dashed horizontal line at y=0 be put into the plot?	
putLegend	logical; should a legend be put into the plot?	
add	logical; should expression set intensities be plotted onto current device instead of a new one?	
maxInterDistance		
	numeric; only used when itype is either "r" or "u"; specifies the maximal distance up to which adjacent probe positions should be connected by a line.	
coord	optional integer of length 2; can be used instead of xlim to specify the start and end coordinates of the genomic region to plot	
verbose	logical; progress output to STDOUT.	
•••	further parameters passed on to plot.default, see details	

Details

The following plot.default arguments are already defined by arguments of this function and thus may not be included in ...: xlim, ylim, col, pch, cex, lwd, lty, frame.plot

The itype argument specifies the desired type of plot. It can be any valid specification of the type argument in plot.default or one of two special types:

- "r" restricted drawing of position-connecting lines. adjacent probe connections will be connected by a line only if less or equal to argument maxInterDistance apart from each other; each probe position will be marked by an individual point anyway (whose shape is determined by the argument ipch).
- "u" similar as "r" but the lines and the points will be unconnected; reminiscent of plot.default's type "b".

Value

invisible matrix of probe intensities in the selected genomic regions

Note

Use the function alongChrom for alternative ways to display probe intensities in genomic regions.

Author(s)

Joern Toedling (toedling@ebi.ac.uk)

```
plot.default; plotAlongChrom in package tilingArray
```

Examples

```
# load data
ringoExampleDir <- system.file("exData",package="Ringo")
load(file.path(ringoExampleDir,"exampleProbeAnno.rda"))
load(file.path(ringoExampleDir,"exampleX.rda"))</pre>
```

compute.gc Compute the GC content of DNA and probe sequences

Description

Simple auxiliary function to compute the GC content of a given set of DNA sequences, such as microarray probe sequences.

Usage

```
compute.gc(probe.sequences, digits = 2)
```

Arguments

probe.sequences	
	character vector of DNA or probe sequences of which the GC content is to be computed
digits	integer specifying the desired precision

Value

a numeric vector with sequence-wise GC contents; the names of this vector are the names of the supplied probe.sequences.

Author(s)

Joern Toedling

computeRunningMedians

See Also

Function basecontent in package matchprobes for a more general function to compute base occurrence in sequences

Examples

```
ex.seqs <- c("gattaca", "GGGNTT", "ggAtT", "tata","gcccg")
names(ex.seqs) <- paste("sequence",1:5,sep="")
compute.gc(ex.seqs)</pre>
```

computeRunningMedians

Function to compute running medians on a tiling expression set

Description

Function to compute running medians (or other quantiles) on a tiling expression set.

Usage

```
computeRunningMedians(xSet, probeAnno, modColumn = "Cy5",
allChr, winHalfSize = 400, min.probes = 5,
quant = 0.5, combineReplicates = FALSE, checkUnique=TRUE,
uniqueCodes=c(0), verbose = TRUE)
```

Arguments

xSet	Object of class ExpressionSet holding the normalized probe intensity data	
probeAnno	Environment holding the genomic positions of probes in the ExpressionSet	
modColumn	Column of the ExpressionSet's phenoData holding the samples' difference of interest	
allChr	Character vector of all chromosomes in genome; if not specified (defaul) all chromosomes annotated in the supplied probeAnno are used.	
winHalfSize	Half the size of the window centered at a probe position, in which all other probes contribute to the calculation of the median.	
min.probes	integer; if less probes are in the sliding window, NA instead of the median is returned. This meant to avoid to computing non-meaningful medians. If un- wanted, set this to 1 or less	
quant	numeric; which quantile to use for the smoothing. The default 0.5 means com- pute the median over the values in the sliding window.	
combineReplicates		
	logical; should the median not be computed over individual samples in the Ex- pressionSet, but should samples be combined according to the column modColumn of the phenoData. The median is then computed across all probe levels and samples of the same type in the window. The resulting ExpressionSet has so many columns as are there different entries in the column modColumn	
checkUnique	logical; indicates whether the uniqueness indicator of probe matches from the probeAnno environment should be used.	
uniqueCodes	numeric; which numeric codes in the chromosome-wise match-uniqueness ele- ments of the probeAnno environment indicate uniqueness?	
verbose	logical; detailed progress output to STDOUT?	

Value

An object of class ExpressionSet, holding smoothed intensity values for the probes of the supplied ExpressionSet. The number of results samples is the number of levels in the supplied modColumn of the supplied ExpressionSet's phenoData.

Author(s)

Joern Toedling (toedling@ebi.ac.uk)

ExpressionSet, sliding.quantile, probeAnno-class

Examples

```
exDir <- system.file("exData",package="Ringo")
load(file.path(exDir,"exampleProbeAnno.rda"))
load(file.path(exDir,"exampleX.rda"))
smoothX <- computeRunningMedians(exampleX, probeAnno=exProbeAnno,
modColumn = "Cy5", allChr = c("9"), winHalfSize = 400, verbose = TRUE)
if (interactive()) {
    par(mfrow=c(1,1))
    chipAlongChrom(exampleX, chrom="9", xlim=c(34318000,34321000), ylim=c(-2,4), probeAnno
    chipAlongChrom(smoothX, chrom="9", xlim=c(34318000,34321000), ylim=c(-2,4), probeAnno
    chipAlongChrom(smoothX, chrom="9", xlim=c(34318000,34321000),
probeAnno=exProbeAnno, itype="1", ilwd=4, paletteName="Spectral",
add=TRUE)
  }
```

computeSlidingT Function to compute sliding T statistics on a tiling expression set

Description

Function to compute sliding (regularized) one- or two-sample T statistics on a tiling expression set.

Usage

```
computeSlidingT(xSet, probeAnno, allChr = c(1:19, "X", "Y"), test = "one.sample"
```

Arguments

xSet	Object of class ExpressionSet holding the normalized probe intensity data
probeAnno	Environment holding the genomic positions of probes in the ExpressionSet
allChr	Character vector of all chromosomes in genome
test	character; one of one.sample or two.sample
grouping	factor vector of length equal to number of samples, currently not required
winHalfSize	Half the size of the window centered at a probe position, in which all other probes contribute to the calculation of the mean and standard deviation.
min.probes	integer; if less probes are in the sliding window, NA instead of the mean and sd is returned. This is meant to avoid to computing non-meaningful means and standard deviations. If unwanted, set this to 1 or less

corPlot

checkUnique	logical; indicates whether the uniqueness indicator of probe matches from the probeAnno environment should be used.
uniqueCodes	numeric; which numeric codes in the chromosome-wise match-uniqueness ele- ments of the probeAnno environment indicate uniqueness?
verbose	logical; detailed progress output to STDOUT?

Value

An object of class ExpressionSet, holding the T statistics values for the probes of the supplied ExpressionSet. The number of results samples is the number of levels in the supplied factor grouping.

Note

the option two.sample is not implemented yet

Examples

corPlot

Function to plot correlation of different samples

Description

This function can be used to visualize the (rank) correlation in expression data between different samples or sample groups.

```
corPlot(eset, samples = NULL, grouping = NULL, ref = NULL,
useSmoothScatter = TRUE, ...)
```

Arguments

set	object of class ExpressionSet holding the array data, or a numeric matrix instead	
amples	which samples' expression shall be correlated to each other; either a numeric vector of sample numbers in the ExpressionSet or a character vector that must be contained in the sampleNames of the ExpressionSet, default NULL means take all samples in the ExpressionSet	
rouping	an optional factor vector defining if the correlation should be assessed between groups of samples, rather than individual samples. If two or more samples are assigned into the same group, the mean over these samples' expression values is taken before computing correlation. Default NULL means assess correlation between individual samples only.	
ef	reference than only applies if argument grouping is given; see relevel	
useSmoothScatter		
	logical; should the function <pre>smoothScatter</pre> be used? given; see <pre>relevel</pre>	
	additional arguments, not used yet	
rouping	vector of sample numbers in the ExpressionSet or a character vector must be contained in the sampleNames of the ExpressionSet, de NULL means take all samples in the ExpressionSet an optional factor vector defining if the correlation should be assessed bet groups of samples, rather than individual samples. If two or more sample assigned into the same group, the mean over these samples' expression v is taken before computing correlation. Default NULL means assess correl between individual samples only. reference than only applies if argument grouping is given; see relevent ter logical; should the function smoothScatter be used? given; see relevent	

Value

No useful return. The function is called for its side-effect to produce the pairs plot.

Author(s)

Joern Toedling

See Also

ExpressionSet,relevel, pairs, smoothScatter

Examples

```
data(sample.ExpressionSet)
if (interactive())
corPlot(sample.ExpressionSet,
  grouping=paste(sample.ExpressionSet$sex,
  sample.ExpressionSet$type, sep="."))
```

exportCherList Function to export cherList into a file

Description

Function to export cherList into a file of gff or BED format. This files can be imported as tracks into genome browsers.

```
exportCherList(object, filename = "chers.gff", format = "gff3", ...)
```

extractProbeAnno

Arguments

object	an object of class cherList
filename	character; path to file to be written
format	Format of exported file; currently only "gff3" and "bed" are supported
	further arguments to be passed on to the trackSet method

Details

First converts the cherList into an object of class trackSet from package **rtracklayer** and then calls the export method as defined for a trackSet.

Value

returns invisible NULL; called for the side effect of writing the file filename.

Author(s)

Joern Toedling

See Also

Class trackset in package rtracklayer

Examples

```
## Not run:
exDir <- system.file("exData",package="Ringo")
load(file.path(exDir,"exampleProbeAnno.rda"))
load(file.path(exDir,"exampleX.rda"))
smoothX <- computeRunningMedians(exampleX, probeAnno=exProbeAnno,
modColumn = "Cy5", allChr = "9", winHalfSize = 400)
chersX <- findChersOnSmoothed(smoothX, probeAnno=exProbeAnno,
thresholds=0.45, allChr="9", distCutOff=600, cellType="human")
exportCherList(chersX, file="chers.gff")
## End(Not run)
```

extractProbeAnno Build probeAnno from match positions in an RGList

Description

This function can be used to build a probeAnno object from the reporter match positions given in the 'genes' slot of an RGList if present, as is the case with some ChIP-chip microarray platforms, e.g. with certain Agilent ones after reading in the data with read.maimages (..., "agilent").

```
extractProbeAnno(object, format = "agilent", ...)
```

Arguments

object	an object that holds the data and the probe match positions, currently can only be of class RGList
format	in which format are the reporter match positions stored in the object; see details; currently only "agilent" is implemented
	further arguments that are passed on to the function posToProbeAnno

Details

Which information is used for creating the probeAnno is specified by the argument format.

agilent expects that the object is of class RGList. The 'genes' element of the object is taken. This element is expected to have at least a column 'ProbeName', which stores the unique reporter/probe identifiers, and a column 'SystematicName', which holds the probe match position in the format "chr<chromosome>:coordinate1-coordinate2", e.g."chr1:087354051-087354110".

Value

An object of class probeAnno holding the mapping between reporters and genomic positions.

Author(s)

Joern Toedling (toedling@ebi.ac.uk)

See Also

posToProbeAnno, probeAnno-class

features2Probes Function for mapping genomic features to probes

Description

This function creates a mapping between annotated genomic features and probes on the array whose matching genomic positions are stored in a probeAnno environment.

Usage

```
features2Probes(gff, probeAnno, upstream = 5000, checkUnique = TRUE, uniqueCodes
```

Arguments

gff	data.frame holding genomic feature annotation
probeAnno	Object of class environment holding the genomic positions of probes in the ExpressionSet
upstream	up to how many bases upstream of annotated genomic features should probes be counted as related to that feature (see details)
checkUnique	logical; indicates whether the uniqueness indicator of probe matches from the probeAnno environment should be used.

uniqueCodes	numeric; which numeric codes in the chromosome-wise match-uniqueness ele- ments of the probeAnno environment indicate uniqueness?
mem.limit	integer value; what is the maximal allowed size of matrices during the compu- tation; see regionOverlap
verbose	logical; detailed progress output to STDOUT?

Value

The results is a list of length equal to the number of rows in the provided gff, the data.frame of genomic features. The names of the list are the names specified in the gff. Each element of the list is specified by the probes mapping into the genomic region from upstream bases upstream of the feature's start site to the feature's end site. The entries itself are either NULL, if no probe was mapped into this region, or a named numeric vector, with its values being the distances of the probes' middle positions to the feature's start site (which depends on the strand the feature is on) and its names being the identifiers of these probes.

Note

This resulting mapping is not used excessively by other Ringo functions, so creating this mapping is optional at this time, but it may simplify subsequent gene/transcript-based analyses.

Here, the term *feature* describes a genomic entity such as a gene, transcript, non-coding RNA or a similar feature annotated to a genome. It does NOT refer to oligo-nucleotide or cDNA probes on the microarray.

```

findChersOnSmoothed

Find ChIP-enriched regions on smoothed ExpressionSet

Description

Given an ExpressionSet of smoothed probe intensities, an environment with the mapping of probes to chromosomes, and a vector of thresholds for calling genomic sites enriched, this function finds the 'chers' (ChIP-enriched regions) consisting of enriched genomic positions, with probes mapped to them. 'Adjacent' enriched positions are condensed into a single Cher.

Usage

```
findChersOnSmoothed(smoothedX, probeAnno, thresholds, allChr = NULL,
    distCutOff = 600, minProbesInRow = 3, cellType = NULL,
    antibodyColumn=NULL, checkUnique = TRUE, uniqueCodes = c(0),
    verbose = TRUE)
```

Arguments

smoothedX	Object of class ExpressionSet holding the smoothed probe intensities, e.g. the result of function computeRunningMedians.
probeAnno	environment containing the probe to genome mapping
thresholds	numeric vector of threshold above which smoothed probe intensities are consid- ered to correspond to enriched probes. The vector has to be of length equal the number of samples in smoothedX, with a single threshold for each sample.
allChr	character vector of all chromosomes on which enriched regions are sought. Ev- ery chromosome here has to have probes mapped to it in the probeAnno envi- ronment. By default (NULL) the chromosomeNames of the probeAnno object are used.
distCutOff	integer; maximum amount of base pairs at which enriched probes are condensed into one Cher.
minProbesInR	OW
	integer; minimum number of enriched probes required for a Cher; see details for further explanation.
cellType	character; name of cell type the data comes from, is either a. of length one in- dicating the column of pData(smoothedX) that holds the cell type OR b. of length one indicating the common cell type for all samples in the ExpressionSet OR c. of length equal to ncol(smoothedX) specifying the cell type of each sample individually.
antibodyColu	n
	the name or number of the column of the pData(smoothedX) that holds the description of the antibody used for each sample. This information is used to annotate found ChIP-enriched regions accordingly. If NULL (default), the sampleNames of smoothedX are used.
checkUnique	logical; indicates whether the uniqueness indicator of probe matches from the probeAnno environment should be used.
uniqueCodes	numeric; which numeric codes in the chromosome-wise match-uniqueness ele- ments of the probeAnno environment indicate uniqueness?
verbose	logical; extended output to STDOUT?

Details

Specifying a minimum number of probes for a Cher (argument minProbesInRow) guarantees that a Cher is supported by a reasonable number of measurements in probe-sparse regions. For example, if there's only one enriched probe within a certain genomic 1kb region and no other probes can been mapped to that region, this single probe does arguably not provide enough evidence for calling this genomic region enriched.

Value

A list of class cherList, holding objects of class cher that were found on the supplied data.

ftr2xys

Convert a NimbleScan ftr-file into a xys-file

Description

Auxiliary function to convert a NimbleScan feature-report file into a xys-file that can be used with the function read.xysfiles of package oligo.

Usage

```
ftr2xys(ftr.file, path=getwd())
```

Arguments

ftr.file	character; file path of feature report file to convert into an xys file
path	file path to directory where the xys-file should be written to; defaults to the current working directory

Details

The output file is names as the input ftr file; with the file extension .ftr replaced by .xys.

Value

Function returns only NULL invisibly and is only called for its side effect to write the xys-file into the current working directory.

Note

This function should only be used with one-color Nimblegen microarrays and when the correct xysfile of the raw data is not available. The output file can be used with the function read.xysfiles of package oligo.

getFeats

Author(s)

Joern Toedling (toedling@ebi.ac.uk)

Examples

```
## Not run:
    sapply(list.files(pattern=".ftr$"),ftr2xys)
    library(oligo)
    fs = read.xysfiles(list.xysfiles())
## End(Not run)
```

getFeats

```
Utility function to extract all features from a cherList
```

Description

This is a small utility function for extracting all related features from a *cherList*, a list of *ChIP*enriched regions.

Usage

```
getFeats(cl)
```

Arguments

cl object of class cherList, a list of cher objects

Value

a character vector containing the names of all features that were associated to any ChIP-enriched region in the list before, using the function relateChers

Author(s)

Joern Toedling

See Also

relateChers,cher-class

newCher

Description

This is just a simple convenience function to create a list of class cher (ChIP-enriched region).

Usage

newCher(name, chr, start, end, cellType = NULL, antibody, maxLevel, score = NULL

Arguments

name	character; (if possible) unique identifier for the cher
chr	character; chromosome the cher is located on
start	integer; genomic start coordinate of the Cher
end	integer; genomic end coordinate of the Cher
cellType	optional character describing the cell type in which the cher was identified.
antibody	required character vector describing the antibody or other characteristic for which fragments were supposedly enriched in immuno-precipitation step
maxLevel	numeric; maximal probe level in the cher
score	optional numeric score of the cher
probes	optional character vector of probe identifiers of probes that make up the cher
	further arguments that will be additional elements of the cher list object

Value

a list object of class cher, see cher-class

Note

this function is called by other Ringo functions, such as findChersOnSmoothed and normally need not be called by the user.

Author(s)

Tammo Krueger, Joern Toedling

See Also

cher-class, findChersOnSmoothed

Examples

nimblegenScale Function to compute scaled log-ratios

Description

This function compute the scaled log-ratios from raw probe intensities, as done by Nimblegen for scaling of ChIP-chip data.

Usage

```
nimblegenScale(myRG, ...)
```

Arguments

myRG	Object of class RGList
•••	further arguments passed on to tukey.biweight

Details

Nimblegen provides scaled log-ratios as normalized values for the probes. log.ratio = log2(R)-log2(G) scaled.ratio = log.ratio - tukey.biweight(log.ratio)

Value

Return an MAList, with the M slot of the list holding the scaled log ratios.

Author(s)

Joern Toedling (toedling@ebi.ac.uk)

References

for more details on the Tukey biweight estimator: Statistical Algorithms Description Document, 2002, Affymetrix.

nonzero-methods Methods for Function nonzero

Description

Auxiliary functions to retrieve the indices of non-zero elements in sparse matrices.

Value

A two-column matrix. Each row gives the row and column index of a non-zero element in the supplied matrix x.

Methods

- x = "dgCMatrix" returns the indices of non-zero elements in matrices of class dgCMatrix
- x = "matrix.csr" returns the indices of non-zero elements in matrices of class matrix.csr
- x = "matrix" returns the indices of non-zero elements in matrices of base class matrix; equivalent to which (x != 0, arr.ind=TRUE)

Note

 $\label{eq:constraint} \begin{array}{l} \text{Originally we used the matrix.csr class from SparseM, but we have switched to the class}\\ \texttt{dgCMatrix from package Matrix, as that package is part of the R distribution bundle now.} \end{array}$

The idea is to have a function similar to which (x != 0, arr.ind=TRUE) if x is a matrix.

See Also

dgCMatrix-class

Examples

```
plot.autocor.result
```

Plots auto-correlation of probe intensities

Description

Function to plot the auto-correlation of probe intensities computed by function autocor.

Usage

```
## S3 method for class 'autocor.result':
plot(x,
plot.title = "ChIP: Autocorrelation of Intensities", ...)
```

Arguments

Х	an object of class autocor.result, the result of function autocor
plot.title	main title of the plot
•••	further arguments passed on to plot.default, see details

Details

The following arguments to plot.default are already defined in the function and thus cannot be specified by the user as further arguments in ...: type, lwd, xlab, ylab, col. Argument main is specified in plot.title.

plotBM

Value

invisible NULL

Author(s)

Joern Toedling $\langle toedling@ebi.ac.uk \rangle$

See Also

autocor

Examples

see the help page of 'autocor' for an example

plotBM

Visualization of a binary matrix

Description

This function produces simple, heatmap-like visualizations of binary matrices.

Usage

```
plotBM(x, boxCol = "darkblue", reorder = FALSE, frame = TRUE, ...)
```

Arguments

х	Binary matrix to visualize
boxCol	Color to use for boxes of '1's
reorder	logical; states whether the rows shall be reordered according to the size of the category
frame	logical; states whether a frame should be drawn around the visualization. In contrast to the frame drawn in plot.default, there is no gap between the visualization and this frame.
	further arguments passed on to plot.default

Details

For reordering, each row is interpreted as a binary matrix, for example a row z=(1,0,0,1) would be interpreted as the binary number 1001 = 9 in the decimal system. Rows are then reordered by the frequency of each binary number with the rows that correspond to the most frequent binary number shown at the top in the visualization.

Value

The function invisibly returns the (reordered) matrix x, but its mainly called for its side effect of producing the visualization.

plot.cher

Note

An alternative way to display such matrices are given by heatmap or, the simpler version thereof, image. However, image files produced with this functions tend to be very large. This function uses plot.default and polygon which results in much smaller file sizes and is sufficient for binary matrices.

Examples

plot.cher

Plot identified Chers

Description

Function for plotting identified Chers (ChIP-enriched regions).

Usage

```
## S4 method for signature 'cher, ExpressionSet':
plot(x, dat, probeAnno, samples=NULL, extent = 1000, gff = NULL, ...)
```

Arguments

х	object of class cher
dat	data object of class ExpressionSet that was used for function findChersOnSmoothed
probeAnno	object of class probeAnno holding the reporter/probe to genome mappings
samples	which samples to plot, either a numeric vector of entries in 1 to ncol(dat), or character vector with entries in sampleNames(dat) or NULL meaning plot the levels from all samples in the ExpressionSet
extent	integer; how many base pairs to the left and right should the plotted genomic region be extended
gff	data frame with gene/transcript annotation
•••	further arguments passed on to function chipAlongChrom

Value

called for generating the plot; invisible (NULL)

Author(s)

Joern Toedling

See Also

chipAlongChrom, cher-class

posToProbeAnno Function for creating a probeAnno environment

Description

This function allows the user to create a probeAnno environment that holds the mapping between probes on the array and their genomic match position(s). As input, the function takes either a.) one of NimbleGen's POS file or a similar file that holds the mapping of probes to the genome. OR b.) a data.frame holding this information

Usage

```
posToProbeAnno(pos, chrNameColumn = "CHROMOSOME",
    probeColumn = "PROBE_ID", chrPositionColumn = "POSITION",
    lengthColumn = "LENGTH", sep="\t", genome="unknown",
    microarrayPlatform="unknown", verbose = TRUE, ...)
```

Arguments

pos	either a file-name that specifies the path to the POS or other mapping file OR a data.frame holding the mapping
chrNameColum	n
	name of the column in the file or ${\tt data.frame}$ that holds the chromosome name of the match
probeColumn	name of the column that holds the matching probe's unique identifier
chrPositionC	olumn
	name of the column that holds the match genomic position/coordinate on the chromosome
lengthColumn	name of the column that holds the length of the match position, in case of perfect match should correspond to the sequence length of the probe
sep	string; denotes the seperator between elements in the supplied mappings file pos; passed on to function scan; ignored if pos is not a filename.
genome	string; denotes genome (and assembly) the reporters have been mapped to for this probeAnno object, e.g. "M. musculus (mm9)"
microarrayPl	atform
	string; denotes the commercial or custom microarray platform/design that holds the reporters whose mapping is stored in this probeAnno object, e.g. "Nimble- Gen MOD SUZ12"
verbose	logical; should progress be written to STDOUT?
	further arguments passed on to function \texttt{scan} , which is used for reading in the file \texttt{pos} .

preprocess

Details

The default column names correspond to the column names in a NimbleGen POS file.

For custom mappings, using the tools Exonerate, BLAT or MUMmer, the scripts directory of this package holds Perl scripts to generate such a POS file from the respective output files.

Value

The results is an object of class probeAnno.

Author(s)

Joern Toedling (toedling@ebi.ac.uk)

See Also

probeAnno-class, scan

Examples

preprocess

Preprocess Raw ChIP-chip Intensities

Description

Calls one of various (limma) functions to transform raw probe intensities into (background-corrected) normalized log ratios (M-values).

Arguments

myRG	object of class RGList
method	string; denoting which normalization method to choose, see below for details
ChIPChannel	string; which element of the RGList holds the ChIP result, see details
inputChannel	string; which element of the RGList holds the untreated <i>input</i> sample; see details
returnMAList	logical; should an MAList object be returned? Default is to return an ExpressionSet object.
idColumn	string; indicating which column of the genes data.frame of the RGList holds the identifier for reporters on the microarray. This column, after calling make.names on it, will make up the unique featureNames of the resulting ExpressionSet. If argument returnMAList is TRUE, this argument is ignored.
verbose	logical; progress output to STDOUT?
	further arguments to be passed on normalizeWithinArrays and normalizeBetweenArray

Details

The procedure and called limma functions depend on the choice of method.

loess Calls normalizeWithinArrays with method="loess".

vsn Calls normalizeBetweenArrays with method="vsn".

Gquantile Calls normalizeBetweenArrays with method="Gquantile".

Rquantile Calls normalizeBetweenArrays with method="Rquantile".

median Calls normalizeWithinArrays with method="median".

- **nimblegen** Scaling procedure used by Nimblegen. Yields scaled log-ratios by a two step procedure: srat = log2(R) log2(G) srat = srat tukey.biweight(srat)
- **Gvsn** Learns vsn model on green channel intensities only and applies that transformation to both channels before computing fold changes.
- **Rvsn** Learns vsn model on red channel intensities only and applies that transformation to both channels before computing fold changes.
- none No normalization of probe intensities, takes raw log2(R)-log2(G) as component M
 and (log2(R)+log2(G))/2 as component A; uses normalizeWithinArrays with
 method="none".

Mostly with two-color ChIP-chip, the ChIP sample is marked with the red Cy5 dye and for the untreated *input* sample the green Cy3 dye is used. In that case the RGListmyRG's element R holds the ChIP data, and element G holds the input data. If this is not the case with your data, use the arguments ChIPChannel and inputChannel to specify the respective elements of myRG.

Value

Returns normalized, transformed values as an object of class ExpressionList or MAList.

Note

Since Ringo version 1.5.6, this function does not call limma's function backgroundCorrect directly any longer. If wanted by the user, background correction should be indicated as additional arguments passed on to normalizeWithinArrays or normalizeBetweenArrays, or alternatively call backgroundCorrect on the RGList before preprocessing.

Examples

probeAnno-class Class "probeAnno"

Description

A class that holds the mapping between reporters/probes on a microarray and their genomic match position(s) in a chosen genome.

Objects from the Class

Objects can be created by calls of the form new ("probeAnno", map, arrayName, genome).

Slots

- map: Object of class "environment" This map consists of four vectors for each chromosome/strand, namely, say for chromosome 1:
 - 1.start genomic start coordinates of probe matches on chromosome 1
 - **1.end** genomic start coordinates of probe matches on chromosome 1

1.index identifier of probes matching at these coordinates

- **1.unique** vector of the same length as the three before; encoding how many matches the corresponding probe has in the given file or data.frame. An entry of '0' indicates that the probe matching at this position has only this one match.
- **arrayName:** Object of class "character", the name or identifier of the microarray design, e.g. 2005-06-17_Ren_MM5Tiling_Set1
- genome: Object of class "character", which genome the reporters have been mapped to

Methods

arrayName obtain the microarray platform name

arrayName<- replace the microarray platform name

[get elements from the map environment

[<- assign elements to the map environment

- **chromosomeNames** obtain a character vector holding the names of the chromosomes for which the probeAnno objects holds a mapping.
- get get elements from the map environment

initialize create mew probeAnno object

ls list elements of the map environment

genome obtain the description of the genome the reporters were mapped to

- genome<- replace the description of the genome the reporters were mapped to
- **as** signature(from="environment"); function to coerce old-style 'probeAnno' environments to newstyle 'probeAnno' objects. Simply creates a new object with the old environment in its map slot

Note

'probeAnno' objects used to be environments and are still in package tilingArray

Author(s)

Joern Toedling (toedling@ebi.ac.uk); Wolfgang Huber

posToProbeAnno

Examples

readNimblegen Func

Description

Function to read in Nimblegen Intensity Text Files into an RGList. Calls some other functions for actual reading of data. This function is to be used with two-color NimbleGen array data. Use the function read.xysfiles of the oligo package for single-color data.

Usage

```
readNimblegen(hybesFile, spotTypesFile, path = getwd(),
headerPattern="# software=NimbleScan",verbose = TRUE, ...)
```

Arguments

hybesFile	Name of the file describing the arrays. In limma this file would be called targets	
	file.	
spotTypesFil	e	
	spot types also used by limma	
path	Path to directoy that hold the files hybesFile, spotTypesFile and also the intensity files. Set this to NULL if you prefer the arguments hybesFile, spotTypesFile and the file-name entries of the hybes file to be treated as absolute or relative file paths themselves.	
headerPattern		
	string; pattern used to identify explantory header lines in the supplied pair- format files	
verbose	logical; progress output to STDOUT?	
•••	further arguments passed on the readNgIntensitiesTxt	

Value

Returns raw intensity values in form of an RGList.

Author(s)

Joern Toedling (toedling@ebi.ac.uk)

See Also

rglist, readTargets

Examples

```
exDir <- system.file("exData",package="Ringo")
exRG <- readNimblegen("example_targets.txt","spottypes.txt",path=exDir)
print(exRG)</pre>
```

regionOverlap

Description

Given two data frames of genomic regions, this function computes the base-pair overlap, if any, between every pair of regions from the two lists.

Usage

```
regionOverlap(xdf, ydf, chrColumn = "chr", startColumn = "start",
endColumn = "end", mem.limit=1e8)
```

Arguments

xdf	data.frame that holds the first set of genomic regions
ydf	data.frame that holds the first set of genomic regions
chrColumn	character; what is the name of the column that holds the chromosome name of the regions in xdf and ydf
startColumn	character; what is the name of the column that holds the start position of the regions in xdf and ydf
endColumn	character; what is the name of the column that holds the start position of the regions in xdf and ydf
mem.limit	integer value; what is the maximal allowed size of matrices during the compu- tation

Value

Originally, a matrix with nrow(xdf) rows and nrow(ydf) columns, in which entry X[i,j] specifies the length of the overlap between region i of the first list (xdf) and region j of the second list (ydf). Since this matrix is very sparse, we use the dgCMatrix representation from the Matrix package for it.

Note

The function only return the absolute length of overlapping regions in base-pairs. It does not return the position of the overlap or the fraction of region 1 and/or region 2 that overlaps the other regions.

The argument mem.limit is not really a limit to used RAM, but rather the maximal size of matrices that should be allowed during the computation. If larger matrices would arise, the second regions list is split into parts and the overlap with the first list is computed for each part. During computation, matrices of size nrow (xdf) times nrow (ydf) are created.

dgCMatrix-class

relateChers

Examples

```
## toy example:
regionsH3ac <- data.frame(chr=c("chr1","chr7","chr8","chr1","chrX","chr8"), start=c(100
regionsH4ac <- data.frame(chr=c("chr1","chr2","chr7","chr8","chr9"),
start=c(500,100,50,80,100), end=c(700, 200, 250, 120,200))
## compare the regions first by eye
## which ones do overlap and by what amount?
regionsH3ac
regionsH4ac
## compare it to the result:
as.matrix(regionOverlap(regionsH3ac, regionsH4ac))
nonzero(regionOverlap(regionsH3ac, regionsH4ac))
```

relateChers Relate found Chers to genomic features

Description

This function relates found 'cher's (ChIP-enriched regions) to annotated genomic features, such as transcripts.

Usage

```
relateChers(pl, gff, upstream = 5000, verbose = TRUE)
```

Arguments

pl	Object of class cherList
gff	data.frame holding genomic feature annotation
upstream	up to how many bases upstream of annotated genomic features should chers be counted as related to that feature (see details)
verbose	logical; extended output to STDOUT?

Details

chers will be counted as related to genomic features, if

- their middle position is located between start and end position of the feature
- their middle position is located not more than argument upstream bases upstream of the feature start

One can visualize such cher-feature relations as a graph using the Bioconductor package Rgraphviz. See the script 'graphChers2Transcripts.R' in Ringo's scripts directory for an example.

Value

An object of class cherList with for each cher the elements typeUpstream and typeInside filled in with the names of the features that have been related to.

Joern Toedling $\langle toedling@ebi.ac.uk \rangle$

Examples

see findChersOnSmoothed for an example

Ringo-internal Internal Ringo functions

Description

Called internally by other Ringo functions. Normally need not be called by the user.

Author(s)

Matt Ritchie, Tammo Krueger, Joern Toedling

sliding.meansd Compute mean and standard deviation of scores in a sliding window

Description

This functions is used to slide a window of specified size over scores at given positions. Computed is the mean and standard deviation over the scores in the window.

Usage

sliding.meansd(positions, scores, half.width)

Arguments

positions	numeric; sorted vector of (genomic) positions of scores
scores	numeric; scores to be smoothed associated to the positions
half.width	numeric, half the window size of the sliding window

Value

Matrix with three columns:

mean	means over scores in running window centered at the positions that were specified in argument positions.
sd	standard deviations over scores in running window centered at the positions that were specified in argument positions.
count	number of points that were considered for computing the mean and standard deviation at each position

sliding.quantile

Author(s)

Joern Toedling and Oleg Sklyar

See Also

sliding.quantile

Examples

sliding.quantile Compute quantile of scores in a sliding window

Description

This functions is used to slide a window of specified size over scores at given positions. Computed is the quantile over the scores in the window.

Usage

Arguments

	positions	numeric; sorted vector of (genomic) positions of scores
	scores	numeric; scores to be smoothed associated to the positions
	half.width	numeric, half the window size of the sliding window
	prob	numeric specifying which quantile is to be computed over the scores in the win- dow; default 0.5 means compute the median over the scores.
return.counts		
		logical; should the number of points, e.g. probes, that were used for computing
		the median in each sliding window also returned?

Value

Matrix with two columns:

quanti	le	medians over running window centered at the positions that were specified in
		argument positions.
count		number of points that were considered for computing the median at each position
7 51		

These positions are given as row.names of the resulting vector. If argument return.counts is FALSE, only a vector of the medians is returned, with the positions as names.

quantile

Examples

twoGaussiansNull Estimate a threshold from Gaussian mixture distribution

Description

Function to estimate a threshold from Gaussian mixture distribution. The data is assumed to follow a mixture of two Gaussian distributions. The one Gaussian with the lower mean value is assumed to be the null distribution and probe levels are assigned p-values based on this null distribution. The threshold is then the minimal data value with an adjusted p-value smaller than a specified threshold.

Usage

twoGaussiansNull(x, p.adj.method = "BY", max.adj.p = 0.1, var.equal = FALSE, ...

Arguments

Х	numeric vector of data values
p.adj.method	$method \ for \ adjusting \ the \ p-values \ for \ multiple \ testing; \ must \ be \ one \ of \ p. adjust. methods$
max.adj.p	which adjusted p-value to use as upper limit for estimating the threshold
var.equal	logical; is the variance of the two Gaussians assumed to be equal or different
	further arguments passed on to function Mclust

Details

This function uses the package mclust to fit a mixture of two Gaussians to the data. The threshold is then estimated from the fitted Gaussian with the lower mean value.

upperBoundNull

Value

Single numeric value. The threshold that is the minimal data value with an adjusted p-value smaller than a specified threshold.

Note

Thanks to Richard Bourgon for pointing out the necessity of providing this method as an alternative way of estimating the threshold.

Author(s)

Joern Toedling, Aleksandra Pekowska

Examples

upperBoundNull *function to estimate upper limit of null distribution*

Description

The data is assumed to arise from a mixture of two distributions, a symmetric null distribution with its mode close to zero, and an alternative distribution that is stochastically larger than the null. This function tries to pinpoint the minimum of data values that are more likely to arise from the alternative distribution, i.e. an upper bound for values following the null distribution.

```
upperBoundNull(x, modeMethod = "shorth", limits = c(-1, 1), prob = 0.99, ...)
```

Arguments

Х	numeric vector of data values
modeMethod	character string; which method to use for estimating the mode of the null distribution; see details
limits	numeric of length 2; data values within this range are used for estimating the mode of the null distribution
prob	quantile of the null distribution that will be used as an upper bound
	additional arguments that are passed on to the function for mode estimation

Details

For estimating the mode of the null distribution, current options are

"shorth" the function shorth

"half.range.mode" the function half.range.mode

"null" does not estimate the mode from the data, but sets it to 0

Value

a single numeric value which is the estimated upper bound for the null distribution.

Note

This way of estimating the null distribution is mentioned in the PhD thesis of Richard Bourgon.

Author(s)

Joern Toedling $\langle toedling@ebi.ac.uk \rangle$, based on suggestions by Richard Bourgon

Examples

validProbeAnno Function to check a probeAnno environment

Description

This function checks whether a probeAnno environment seems to be valid and will work with other Ringo functions.

Usage

```
validProbeAnno(probeAnno)
```

Arguments

probeAnno an environment that holds probe matches to genomic coordinates

Details

This function checks certain properties of the mapping environment that are used by other Ringo functions. It can indicate potential problems in the environment.

Value

TRUE if the environment seems to be a valid probeAnno environment, FALSE if a potential problems with this environment was identified. This potential problem is explained as a warning.
