Bed15TrackLine-class

Class "Bed15TrackLine"

Description

A UCSC track line for graphical tracks.

Objects from the Class

Objects can be created by calls of the form `new("Bed15TrackLine", ...)` or parsed from a character vector track line with `as(text, "Bed15TrackLine")`.

Slots

`expStep`: A "numeric" scalar indicating the step size for the heatmap color gradient.

`expScale`: A positive "numeric" scalar indicating the range of the data to be `[-expScale, expScale]` for determining the heatmap color gradient.

`expNames`: A "character" vector naming the the experimental samples.

`name`: Object of class "character" specifying the name of the track.

`description`: Object of class "character" describing the track.

`visibility`: Object of class "character" indicating the default visible mode of the track, see [UCSCTrackModes](#).

`color`: Object of class "integer" representing the track color (as from [col2rgb](#)).

`priority`: Object of class "numeric" specifying the rank of this track.

Extends

Class "[TrackLine](#)", directly.

Methods

`as(object, "character")` Export line to its string representation.

Author(s)

Michael Lawrence

References

Official documentation: http://genomewiki.ucsc.edu/index.php/Microarray_track.

See Also

[export.bed15](#) for exporting bed15 tracks.

BigWigSelection-class

Selection of ranges and columns

Description

A `BigWigSelection` represents a query against a BigWig file, see [import.bw](#). It is simply a [RangedSelection](#) that requires its `colnames` parameter to be "score", if non-empty, as that is the only column supported by BigWig.

Constructor

`BigWigSelection(ranges = RangesList(), colnames = "score")`: Constructors a `BigWigSelection` with the given ranges and colnames.

Coercion

`as(from, "BigWigSelection")`: Coerces `from` to a `BigWigSelection` object. Typically, `from` is a [RangesList](#), the ranges of which become the ranges in the new `BigWigSelection`.

Author(s)

Michael Lawrence

Examples

```
rl <- IRanges::RangesList(chr1 = IRanges(c(1, 5), c(3, 6)))

BigWigSelection(rl)
as(rl, "BigWigSelection") # same as above

# do not select the 'score' column
BigWigSelection(rl, character())
```

GenomicSelection *Genomic data selection*

Description

Convenience constructor of a [RangedSelection](#) object for selecting a data on a per-chromosome basis for a given genome.

Usage

```
GenomicSelection(genome, chrom = NULL, colnames = character(0))
```

Arguments

genome	A string identifying a genome. Should match the end of a BSgenome package name, e.g. "hg19".
chrom	Character vector naming chromosomes to select.
colnames	The column names to select from the dataset.

Value

A [RangedSelection](#) object, selecting entire chromosomes

Author(s)

Michael Lawrence

See Also

[RangedSelection](#), [BigWigSelection](#)

Examples

```
# every chromosome from hg19
GenomicSelection("hg19")
# chr1 and 2 from hg19, with a score column
GenomicSelection("hg19", c("chr1", "chr2"), "score")
```

RangedData-methods *Data on a Genome*

Description

The `rtracklayer` package adds convenience methods on top of `RangedData` to manipulate data on genomic ranges. The spaces are now called chromosomes (but could still refer to some other type of sequence). The universe refers to the genome.

Accessors

In the code snippets below, `x` is a `RangedData` object.

`chrom(x)`, `chrom(x) <- value`: Gets or sets the chromosome names for `x`. The length of `value` should equal the length of `x`. This is an alias for `names(x)`.

`genome(x)`, `genome(x) <- value`: Gets or sets the genome (a single string or `NULL`) for the ranges in `x`; simple wrappers around `universe` and `universe<-`, respectively.

Constructor

`GenomicData(ranges, ..., strand = NULL, chrom = NULL, genome = NULL)`:

Constructs a `RangedData` instance with the given ranges and variables in `...` (see the `RangedData` constructor). If non-`NULL`, `strand` specifies the strand of each range. It should be a character vector or factor of length equal to that of `ranges`. All values should be either `-`, `+`, `*` or `NA`. To get these levels, call `levels(strand())`. `chrom` is analogous to `splitter` in `RangedData`; if non-`NULL` it should be coercible to a factor indicating how the ranges, variables and strand should be split up across the chromosomes. The `genome` argument should be a scalar string and is treated as the `RangedData` universe. See the examples.

If `ranges` is not a `Ranges` object, this function calls `as(ranges, "RangedData")` and returns the result if successful. As a special case, the “`chrom`” column in a `data.frame`-like object is renamed to “`space`”, for convenience. Thus, one could pass a `data.frame` with columns “`start`”, “`end`” and, optionally, “`chrom`”.

Author(s)

Michael Lawrence

Examples

```
range1 <- IRanges(start=c(1,2,3), end=c(5,2,8))

## just ranges
gr <- GenomicData(range1)

## with a genome (universe)
gr <- GenomicData(range1, genome = "hg18")
genome(gr) ## "hg18"

## with some data
filter <- c(1L, 0L, 1L)
score <- c(10L, 2L, NA)
strand <- factor(c("+", NA, "-"), levels = levels(strand()))
gr <- GenomicData(range1, score, genome = "hg18")
gr[["score"]]
strand(gr) ## all NA
gr <- GenomicData(range1, score, filt = filter, strand = strand)
gr[["filt"]]
strand(gr) ## equal to 'strand'

range2 <- IRanges(start=c(15,45,20,1), end=c(15,100,80,5))
ranges <- c(range1, range2)
score <- c(score, c(0L, 3L, NA, 22L))
chrom <- paste("chr", rep(c(1,2), c(length(range1), length(range2))), sep="")
```

```

gr <- GenomicData(ranges, score, chrom = chrom, genome = "hg18")
chrom(gr) # equal to 'chrom'
gr[["score"]] # unlists over the chromosomes
score(gr)
gr[1][["score"]] # equal to score[1:3]

df <- as.data.frame(gr)
GenomicData(df)

```

RangesList-methods *Ranges on a Genome*

Description

Genomic coordinates are often specified in terms of a genome identifier, chromosome name, start position and end position. This information can be represented by a `RangesList` instance, and the `rtracklayer` package adds convenience methods to `RangesList` for the manipulation of genomic ranges. The spaces (or names) of `RangesList` are the chromosome names. The `universe` slot indicates the genome, usually as given by UCSC (e.g. “hg18”).

Accessors

In the code snippets below, `x` is a `RangesList` object.

`chrom(x)`, `chrom(x) <- value`: Gets or sets the chromosome names for `x`. This is an alias for `names(x)`.

`genome(x)`, `genome(x) <- value`: Gets or sets the genome (a single string or `NULL`) for the ranges in `x`; simple wrappers around `universe` and `universe<-`, respectively.

Constructor

`GenomicRanges(start, end, chrom = NULL, genome = NULL)`: Constructs a `RangesList` containing ranges specified by `start` and `end`, optionally split into elements based on `chrom`, a vector of chromosome identifiers (or `NULL` for no splitting). The `genome` argument should be a scalar string and is treated as the `RangesList` `universe`. See the examples.

Author(s)

Michael Lawrence

Examples

```

GenomicRanges(c(1,2,3), c(5,2,8))
GenomicRanges(c(1,2,3), c(5,2,8), c("chr1", "chr1", "chr2"))
GenomicRanges(c(1,2,3), c(5,2,8), genome = "hg18")

```

UCSCData-class *Class "UCSCData"*

Description

Each track in UCSC has an associated [TrackLine](#) that contains metadata on the track.

Slots

`trackLine`: Object of class "TrackLine" holding track metadata.

Methods

`export.bed(object, con, variant = c("base", "bedGraph", "bed15"), color, trackLine)`
 Exports the track and its track line (if `trackLine` is TRUE) to `con` in the Browser Extended Display (BED) format. The arguments in `...` are passed to `export.ucsc`.

`export.bed15(object, con, expNames = NULL, ...)` Exports the track and its track line (if `trackLine` is TRUE) to `con` in the Bed15 format. The data is taken from the columns named in `expNames`, which defaults to the `expNames` in the track line, if any, otherwise all column names. The arguments in `...` are passed to `export.ucsc`.

`export.gff(object)` Exports the track and its track line (as a comment) to `con` in the General Feature Format (GFF).

`export.ucsc(object, con, subformat, ...)` Exports the track and its track line to `con` in the UCSC meta-format.

`as(object, "UCSCData")` Constructs a `UCSCData` from a `RangedData` instance, by adding a default track line and ensuring that the sequence/chromosome names are compliant with UCSC conventions. If there is a numeric score, the track line type is either "bedGraph" or "wig", depending on the feature density. Otherwise, "bed" is chosen.

UCSCTableQuery-class
Querying UCSC Tables

Description

The UCSC genome browser is backed by a large database, which is exposed by the Table Browser web interface. Tracks are stored as tables, so this is also the mechanism for retrieving tracks. The `UCSCTableQuery` class represents a query against the Table Browser. Storing the query fields in a formal class facilitates incremental construction and adjustment of a query.

Details

There are five supported fields for a table query:

session The `UCSCSession` instance from the tables are retrieved. Although all sessions are based on the same database, the set of user-uploaded tracks, which are represented as tables, is not the same, in general.

trackName The name of a track from which to retrieve a table. Each track can have multiple tables. Many times there is a primary table that is used to display the track, while the other tables are supplemental. Sometimes, tracks are displayed by aggregating multiple tables.

tableName The name of the specific table to retrieve. May be `NULL`, in which case the behavior depends on how the query is executed, see below.

range A `RangesList` indicating the portion of the table to retrieve, in genome coordinates. The genome indicated by the `RangesList` also determines which tracks are available and must always be non-`NULL`. If the `RangesList` is empty, the table is downloaded for the entire genome.

names Names/accessions of the desired features

A common workflow for querying the UCSC database is to create an instance of `UCSCTableQuery` using the `ucscTableQuery` constructor, invoke `tableNames` to list the available tables for a track, and finally to retrieve the desired table either as a `data.frame` via `getTable` or as a `RangedData` track via `track`. See the examples.

The reason for a formal query class is to facilitate multiple queries when the differences between the queries are small. For example, one might want to query multiple tables within the track and/or same genomic region, or query the same table for multiple regions. The `UCSCTableQuery` instance can be incrementally adjusted for each new query. Some caching is also performed, which enhances performance.

Constructor

```
ucscTableQuery(x, track, range = GenomicRanges(), table = NULL, names = NULL): Creates a UCSCTableQuery with the UCSCSession given as x and the track name given by the single string track. range should be a RangesList instance, and it effectively defaults to range(x). Any missing information in range, often the genome identifier, is filled in from range(x). The table name is given by table, which may be a single string or NULL. Feature names, such as gene identifiers, may be passed via names as a character vector.
```

Executing Queries

Below, `object` is a `UCSCTableQuery` instance.

`track(object)`: Retrieves the indicated table as a track, i.e. a `RangedData` instance. Note that not all tables are available as tracks.

`getTable(object)`: Retrieves the indicated table as a `data.frame`. Note that not all tables are output in parseable form.

`tableNames(object)`: Gets the names of the tables available for the session, track and range specified by the query.

Accessor methods

In the code snippets below, `x/object` is a `UCSCTableQuery` object.

`browserSession(object), browserSession(object) <- value:` Get or set the UCSCSession to query.

`trackName(x), trackName(x) <- value:` Get or set the single string indicating the track containing the table of interest.

`trackNames(x)` List the names of the tracks available for retrieval for the assigned genome.

`tableName(x), tableName(x) <- value:` Get or set the single string indicating the name of the table to retrieve. May be `NULL`, in which case the table is automatically determined.

`range(x), range(x) <- value:` Get or set the `RangesList` indicating the portion of the table to retrieve in genomic coordinates. Any missing information, such as the genome identifier, is filled in using `range(browserSession(x))`.

`names(x), names(x) <- value:` Get or set the names of the features to retrieve. If `NULL`, this filter is disabled.

Author(s)

Michael Lawrence

Examples

```
## Not run:
session <- browserSession()
genome(session) <- "mm9"
trackNames(session) ## list the track names
## choose the Conservation track for a portion of mm9 chr1
query <- ucscTableQuery(session, "Conservation",
                        GenomicRanges(57795963, 57815592, "chr12"))
## list the table names
tableNames(query)
## get the phastCons30way track
tableName(query) <- "phastCons30way"
## retrieve the track data
track(query)
## get a data.frame summarizing the multiple alignment
tableName(query) <- "multiz30waySummary"
getTable(query)

genome(session) <- "hg18"
query <- ucscTableQuery(session, "snp129",
                        names = c("rs10003974", "rs10087355", "rs10075230"))
getTable(query)

## End(Not run)
```

activeView-methods *Accessing the active view*

Description

Get the active view.

Methods

The following methods are defined by **rtracklayer**.

object = "BrowserSession" activeView(object): Gets the active [BrowserView](#) from a browser session.

activeView(object) <- value: Sets the active [BrowserView](#) in a browser session.

BasicTrackLine-class

Class "BasicTrackLine"

Description

The type of UCSC track line used to annotate most types of tracks (every type except [Wiggle](#)).

Objects from the Class

Objects can be created by calls of the form `new("BasicTrackLine", ...)` or parsed from a character vector track line with `as(text, "BasicTrackLine")` or converted from a [GraphTrackLine](#) using `as(wig, "BasicTrackLine")`.

Slots

itemRgb: Object of class "logical" indicating whether each feature in a track uploaded as BED should be drawn in its specified color.

useScore: Object of class "logical" indicating whether the data value should be mapped to color.

group: Object of class "character" naming a group to which this track should belong.

db: Object of class "character" indicating the associated genome assembly.

offset: Object of class "numeric", a number added to all positions in the track.

url: Object of class "character" referring to additional information about this track.

htmlUrl: Object of class "character" referring to an HTML page to be displayed with this track.

name: Object of class "character" specifying the name of the track.

description: Object of class "character" describing the track.

visibility: Object of class "character" indicating the default visible mode of the track, see [UCSCTrackModes](#).

color: Object of class "integer" representing the track color (as from [col2rgb](#)).

priority: Object of class "numeric" specifying the rank of the track.

Extends

Class "[TrackLine](#)", directly.

Methods

as(object, "character") Export line to its string representation.

as(object, "[GraphTrackLine](#)") Convert this line to a graph track line, using defaults for slots not held in common.

Author(s)

Michael Lawrence

References

<http://genome.ucsc.edu/goldenPath/help/customTrack.html#TRACK> for the official documentation.

See Also

[GraphTrackLine](#) for Wiggle/bedGraph tracks.

blocks-methods

Get blocks/exons

Description

Obtains the block ranges (subranges, usually exons) from an object, such as a [RangedData](#) imported from a BED file.

Usage

```
blocks(x, ...)
```

Arguments

x	The instance from which to obtain the block/exon information. Currently must be a RangedData , presumably imported with import.bed .
...	Additional arguments for methods

Details

For the [RangedData](#) method, there must be two columns in x: `blockStarts` and `blockSizes`, each field of which should be a comma-separated list of block starts and widths, respectively. This comes from the BED specification.

Author(s)

Michael Lawrence

See Also

[import.bed](#) for importing a track from BED, which can store block information.

browseGenome	<i>Browse a genome</i>
--------------	------------------------

Description

A generic function for launching a genome browser.

Usage

```
browseGenome(object, ...)
## S4 method for signature 'RangedDataORRangedDataList':
browseGenome(object,
  browser = "UCSC", range = base::range(object),
  view = TRUE, trackParams = list(), viewParams = list(), ...)
```

Arguments

object	A list of RangedData instances, e.g. a RangedDataList instance.
browser	The name of the genome browser.
range	The RangesList to display in the initial view.
view	Whether to open a view.
trackParams	Named list of parameters to pass to track<- .
viewParams	Named list of parameters to pass to browserView .
...	Arguments corresponding to slots in RangesList that override those in <code>range</code> .

Value

Returns a [BrowserSession](#).

Author(s)

Michael Lawrence

See Also

[BrowserSession](#) and [BrowserView](#), the two main classes for interfacing with genome browsers.

Examples

```
## Not run:
## open UCSC genome browser:
browseGenome()
## to view a specific range:
range <- GenomicRanges("hg18", "chr22", 20000, 50000)
browseGenome(range = range)
## a slightly larger range:
browseGenome(range = range, end = 75000)
## with a track:
track <- import(system.file("tests", "v1.gff", package = "rtracklayer"))
browseGenome(RangedDataList(track))

## End(Not run)
```

 BrowserSession-class

Class "BrowserSession"

Description

An object representing a genome browser session. Each session corresponds to a set of loaded tracks and a set of [BrowserView](#) instances. Note that this is a virtual class; a concrete implementation is provided by each backend driver.

Objects from the Class

A virtual Class: No objects may be created from it. See [browserSession](#) for obtaining an instance of an implementation for a particular genome browser.

Methods

This specifies the API implemented by each browser backend. Note that a backend is not guaranteed to support all operations, and that each backend often has additional parameters for each of the methods. See the backend-specific documentation for more details. The only built-in backend is [UCSCSession](#).

[browserView](#)(object, range = range(object), track = trackNames(object), ...) Constructs a [BrowserView](#) of range for this session.

[browserViews](#)(object, ...) Gets the [BrowserView](#) instances belonging to this session.

[activeView](#)(object, ...) Returns the [BrowserView](#) that is currently active in the session.

[range](#)(x, ...) Gets the [RangesList](#) representing the range of the genome currently displayed by the browser (i.e. the range shown by the active view) or a default value (possibly NULL) if no views exist.

[getSeq](#)(object, range = range(object), ...) gets a genomic sequence of range from this session.

[sequence](#)(object, ...) <- value Loads a sequence into the session.

[track](#)(object, name = deparse(substitute(track)), view = TRUE, ...) <- value Loads one or more tracks into the session and optionally open a view of the track.

[x\[\[i\]\]](#) <- value Loads the track value into session x, under the name i. Shortcut to above.

[x\\$name](#) <- value Loads the track value into session x, under the name name. Shortcut to above.

[track](#)(object, ...) Gets a track from a session as a [RangedData](#).

[x\[\[i\]\]](#) Gets the track named i from session x. A shortcut to [track](#).

[x\\$name](#) Gets the track named name from session x. A shortcut to [track](#).

[trackNames](#)(object, ...) Gets the names of the tracks stored in this session.

[genome](#)(x), [genome](#)(x) <- value Gets or sets the genome identifier (e.g. "hg18") for the session.

[close](#)(con, ...) Close this session.

[show](#)(object, ...) Output a textual description of this session.

Author(s)

Michael Lawrence

See Also

[browserSession](#) for obtaining implementations of this class for a particular genome browser.

browserSession-methods

Get a genome browser session

Description

Methods for getting browser sessions.

Methods

The following methods are defined by **rtracklayer**.

object = "character" `browserSession(object, ...)`: Creates a [BrowserSession](#) from a genome browser identifier. The identifier corresponds to the prefix of the session class name (e.g. "ucsc" in "UCSCSession"). The arguments in ... are passed to the initialization function of the class.

object = "browserView" Gets the [BrowserSession](#) for the view.

object = "missing" Calls `browserSession("ucsc", ...)`.

BrowserView-class *Class "BrowserView"*

Description

An object representing a genome browser view of a particular segment of a genome.

Objects from the Class

A virtual Class: No objects may be created from it directly. See [browserView](#) for obtaining an instance of an implementation for a particular genome browser.

Slots

session: Object of class "BrowserSession" the browser session to which this view belongs.

Methods

This specifies the API implemented by each browser backend. Note that a backend is not guaranteed to support all operations. See the backend-specific documentation for more details. The only built-in backend is `UCSCView`.

`browserSession(object)` Obtains the `BrowserSession` to which this view belongs.
`close(object)` Close this view.
`range(object)` Obtains the `RangesList` displayed by this view.
`trackNames(object)` Gets the names of the visible tracks in the view.
`trackNames(object) <- value` Sets the visible tracks by their names.
`show(object)` Outputs a textual description of this view.
`visible(object)` Get a named logical vector indicating whether each track is visible.
`visible(object) <- value` Set a logical vector indicating the visibility of each track, with the same names and in the same order as that returned by `visible(object)`.

Author(s)

Michael Lawrence

See Also

`browserView` for obtaining instances of this class.

browserView-methods

Getting browser views

Description

Methods for creating and getting browser views.

Usage

```
browserView(object, range, track, ...)
```

Arguments

<code>object</code>	The object from which to get the views.
<code>range</code>	The <code>RangesList</code> to display.
<code>track</code>	List of track names to make visible in the view.
<code>...</code>	Arguments to pass to methods

Methods

The following methods are defined by `rtracklayer`.

object = "UCSCSession" `browserView(object, range = range(object), track = trackNames(object), imagewidth = 800, ...)`: Creates a `BrowserView` of `range` with visible tracks specified by `track`. The `imagewidth` parameter specifies the width of the track image in pixels. `track` may be an instance of `UCSCTrackModes`. Arguments in `...` are passed to `ucscTrackModes` to create the `UCSCTrackModes` instance that will override modes indicated by the `track` parameter.

Examples

```
## Not run:
  session <- browserSession()
  browserView(session, GenomicRanges(20000, 50000, "chr2"))
  ## only view "knownGene" track
  browserView(session, track = "knownGene")

## End(Not run)
```

 browserViews-methods

Getting the browser views

Description

Methods for getting browser views.

Methods

The following methods are defined by **rtracklayer**.

Gets the instances of [BrowserView](#) in the session.

See Also

object = "UCSCSession" [browserView](#) for creating a browser view.

Examples

```
## Not run:
  session <- browseGenome()
  browserViews(session)

## End(Not run)
```

 cpneTrack

CPNE1 SNP track

Description

A [RangedData](#) object (created by the [GGtools](#) package) with features from a subset of the SNPs on chromosome 20 from 60 HapMap founders in the CEU cohort. Each SNP has an associated data value indicating its association with the expression of the CPNE1 gene according to a Cochran-Armitage 1df test. The top 5000 scoring SNPs were selected for the track.

Usage

```
data(cpneTrack)
```

Format

Each feature (row) is a SNP. The association test scores are accessible via [score](#).

Source

Vince Carey and the GGtools package.

Examples

```
data(cpneTrack)
plot(start(cpneTrack), score(cpneTrack))
```

export

Export objects to connections

Description

Exports (serializes) an object in a given format to a given connection.

Usage

```
export(object, con, format, ...)
```

Arguments

<code>object</code>	The object to export.
<code>con</code>	The connection to which the object is exported. If this is a character vector, it is assumed to be a filename and a corresponding file connection is created and then closed after exporting the object. If missing, the function will return the output as a character vector, rather than writing to a connection.
<code>format</code>	The format of the output. If missing and <code>con</code> is a filename, the format is derived from the file extension.
<code>...</code>	Parameters to pass to the format-specific export routine.

Details

This function delegates to another function, depending on the specified format. The name of the delegate is of the form `export.format` where `format` is specified by the `format` argument.

Value

If `con` is missing, a character vector containing the string output. Otherwise, nothing is returned.

Author(s)

Michael Lawrence

See Also

[import](#) for the reverse

Examples

```

track <- import(system.file("tests", "v1.gff", package = "rtracklayer"))
## Not run: export(track, "my.gff", version = "3")
## equivalently,
## Not run: export(track, "my.gff3")
## or
## Not run:
con <- file("my.gff3")
export(track, con, "gff3")
close(con)

## End(Not run)
## or as a string
export(track, format = "gff3")

```

export-tracks

Export tracks

Description

These functions output [RangedData](#) instances in various formats.

Usage

```

export.gff(object, con, version = c("1", "2", "3"), source =
  "rtracklayer", append = FALSE, ...)
export.gff1(object, con, ...)
export.gff2(object, con, ...)
export.gff3(object, con, ...)
export.bed(object, con, variant = c("base", "bedGraph", "bed15"),
  color = NULL, append = FALSE, ...)
export.bed15(object, con, expNames = NULL, ...)
export.bedGraph(object, con, ...)
export.wig(object, con,
  dataFormat = c("auto", "variableStep", "fixedStep"), ...)
export.ucsc(object, con, subformat = c("auto", "gff1", "wig", "bed",
  "bed15", "bedGraph"), append = FALSE, ...)
## not yet supported on Windows
export.bw(object, con,
  dataFormat = c("auto", "variableStep", "fixedStep", "bedGraph"),
  seqlengths = NULL, compress = TRUE, ...)

```

Arguments

object	The object to export, such as a RangedData , or anything coercible to a RangedData . If a UCSCData , the track line information is output. In the case of <code>export.bed15</code> , <code>export.bedGraph</code> , <code>export.wig</code> , and <code>export.ucsc</code> , a RangedDataList object with possibly multiple tracks is supported.
con	The connection to which the object is exported.
version	The GFF version, either "1", "2" or "3" (default is "1").
source	The source of the GFF information, for GFF.

variant	Which variant of BED lines to output, not for the user.
color	Recycled vector of colors, as interpreted by <code>col2rgb</code> for BED features. If NULL, the <code>color</code> column in the <code>featureData</code> is used, if any.
dataFormat	The format of the data lines for WIG tracks, see references. The "auto" format uses the most efficient format possible.
subformat	The format of the tracks within the UCSC container. If "auto", the type is determined from the trackline. If <code>object</code> is not a <code>UCSCData</code> , this essentially means "wig" or "bedGraph" (depending on the density) if there is a numeric score, else "bed".
expNames	Names of the columns in <code>object</code> that hold the experimental data. Defaults to all column names, unless <code>object</code> is a <code>UCSCData</code> , in which case the <code>expNames</code> field is taken from the track line, if it exists.
seqlengths	The lengths of each sequence in <code>object</code> . If NULL, the chromosome lengths are retrieved for the genome specified on <code>object</code> , if possible.
append	Logical, whether to append the output to the connection
compress	Logical, indicating whether to compress the bigWig output
...	For <code>export.gff1</code> , <code>export.gff2</code> and <code>export.gff3</code> : arguments to pass to <code>export.gff</code> . For <code>export.bed</code> : arguments to pass to methods. For <code>export.bed15</code> , <code>export.bedGraph</code> and <code>export.wig</code> : arguments to pass to <code>export.ucsc</code> . For <code>export.ucsc</code> : arguments to pass to <code>export.subformat</code> or to set on the slots of the <code>TrackLine</code> subclass corresponding to <code>subformat</code> .

Details

The following is some advice for choosing a file format.

GFF The General Feature Format is meant to represent any set of genomic features, with application-specific columns represented as “attributes”. There are three principal versions (1, 2, and 3). This is a good format for interoperating with other genomic tools. UCSC supports GFF1, but it needs to be encapsulated in the UCSC metaformat, i.e. `export.ucsc(subformat = "gff1")`.

BED The Browser Extended Display format is for displaying tracks in a genome browser, in particular UCSC. There are many options to control the appearance of the track, see [GraphTrackLine](#). To output a track line when `object` is not a `UCSCData`, call `export.ucsc(subformat = "bed")`.

BED15 An extension of BED with 15 columns, `Bed15` is meant to represent data from microarray experiments. Multiple samples/columns are supported, and the data is displayed as a compact heatmap. With 15 columns per feature, this format is probably too verbose for e.g. ChIP-seq coverage (use multiple WIG tracks instead).

BEDGRAPH A variant of BED that represents experimental data more compactly than BED and especially BED15, although only one sample is supported. The data is displayed as a bar or line graph. For dense data, WIG is preferred.

WIG The Wiggle format is meant for storing dense numerical data, such as the coverage from a ChIP-seq experiment. The data is displayed as a bar or line graph.

In summary, BED is usually best for displaying qualitative features or sparse quantitative features (like ChIP-seq peaks), while WIG is usually best for displaying dense data like coverage.

In general, columns in the `RangedData` are mapped to the column in the track format of the same name. For example, a column named “`itemRgb`” will be mapped to the corresponding column in

BED-formatted output, while it is ignored for other formats. Missing values are mapped between NA in R and the format-specific missing value indicator, usually “.”. The following describes how the `RangedData` object is mapped to each track format. Default values for columns are given in parentheses.

GFF Maps columns named “source” (“rtracklayer”), “feature” (“sequence”), “score” (“.”), “strand” (“.”), “frame” (“.”), and (version 1 only) “group” (`seqname`). In GFF versions 2 and 3, extra columns are mapped to attributes.

BED Maps columns named “name” (“.”), “score” (“.”), “strand” (“.”), “thickStart” (`start`), “thickEnd” (`end`), “itemRgb” (“0,0,0”), “blockSizes”, and “blockStarts”. Note that the BED field “blockCounts” is derived automatically. The intervals specified by “thickStart”, “thickEnd” and “blockStarts” are 0-based, half-open as in BED. Note that this is different from the chromosome start/end stored in the `Ranges` object (1-based, closed). The “itemRgb” column should be specified in a format understood by `col2rgb`.

BED15 In addition to the behavior for BED above, encodes columns named by the `expNames` parameter into the fields “expCount”, “expIds” and “expScores”.

BEDGRAPH The “score” column is used for the quantitative values.

WIG The “score” column is used for the quantitative values.

Value

If `con` is missing, a character vector containing the string output, otherwise nothing.

See Also

See [export](#) for the high-level interface to these functions.

Examples

```
dummy <- file() # dummy file connection for demo
track <- import(system.file("tests", "bed.wig", package = "rtracklayer"))
## output a track as GFF2
export.gff(track, dummy, version = "2")
## equivalently
export.gff2(track, dummy)
## output as WIG string in variableStep format
wig <- export.wig(track, dummy, dataFormat = "variableStep")
## output multiple tracks in UCSC meta-format
track2 <- import(system.file("tests", "v1.gff", package = "rtracklayer"))
## output to WIG
export.ucsc(RangedDataList(track, track2), dummy, subformat = "wig")
```

genomeBrowsers *Get available genome browsers*

Description

Gets the identifiers of the loaded genome browser drivers.

Usage

```
genomeBrowsers(where = topenv(parent.frame()))
```

Arguments

`where` The environment in which to search for drivers.

Details

This searches the specified environment for classes that extend [BrowserSession](#). The prefix of the class name, e.g. "ucsc" in "UCSCSession", is returned for each driver.

Value

A character vector of driver identifiers.

Author(s)

Michael Lawrence

See Also

[browseGenome](#) and [browserSession](#) that create `browserSession` implementations given an identifier returned from this function.

getSeq-methods *Retrieving a genome sequence*

Description

Methods for retrieving the sequence of a [RangesList](#) from an object.

Methods

The following methods are defined by **rtracklayer** for `getSeq(object, range = range(object), ...)`.

object = "UCSCSession" `getSeq(object, range = range(object), track = "Assembly")`:
Gets the sequence in `range` and `track` from the session.

See Also

[sequence<-](#) for storing sequences.

import *Importing objects*

Description

Imports an object from a connection according to a specified format.

Usage

```
import(con, format, text, ...)
```

Arguments

<code>con</code>	The connection through which the data is received. If this is a character vector, it is assumed to be a filename.
<code>format</code>	The format in which to expect the input. If omitted and <code>con</code> is a filename, the format is taken from the file extension.
<code>text</code>	If <code>con</code> is missing, this can be a character vector directly providing the string data to import.
<code>...</code>	Arguments to pass to the format-specific import routines.

Details

This function delegates to a format-specific function named according to the scheme `import.format` where `format` is specified by the `format` parameter.

Value

The object parsed from the connection or text.

Author(s)

Michael Lawrence

See Also

[export](#) to do the reverse.

Examples

```
track <- import(system.file("tests", "bed.wig", package = "rtracklayer"))
track <- import(system.file("tests", "v1.gff", package = "rtracklayer"), version = "1")
# or
track <- import(system.file("tests", "v1.gff", package = "rtracklayer"), "gff1")
```

<code>import.gff</code>	<i>Importing tracks</i>
-------------------------	-------------------------

Description

These are the functions for importing [RangedData](#) instances from connections or text.

Usage

```
import.gff(con, version = c("1", "2", "3"), genome = "hg18")
import.gff1(con, ...)
import.gff2(con, ...)
import.gff3(con, ...)
import.bed(con, variant = c("base", "bedGraph", "bed15"),
           trackLine = TRUE, genome = "hg18", ...)
import.bed15(con, genome = "hg18", ...)
import.bedGraph(con, genome = "hg18", ...)
import.wig(con, genome = "hg18", ...)
import.ucsc(con,
            subformat = c("auto", "gff1", "wig", "bed", "bed15", "bedGraph"),
            drop = FALSE, ...)
## not yet supported on Windows
import.bw(con, selection = BigWigSelection(...), ...)
```

Arguments

<code>con</code>	The connection, filename or URL from which to receive the input.
<code>version</code>	The version of GFF ("1", "2" or "3").
<code>genome</code>	The genome to set on the imported track.
<code>variant</code>	Variant of BED lines, not for the user.
<code>trackLine</code>	Whether the BED data has a track line (it normally does though track lines are not mandatory).
<code>subformat</code>	The expected subformat of the UCSC data. If "auto", automatic detection of the subformat is attempted.
<code>drop</code>	If TRUE and there is only one track in the UCSC data, return the track instead of a list.
<code>selection</code>	A RangedSelection object indicating the intervals to retrieve from a bigWig file. Note that this retrieval is very efficient, due to the indexing of the bigWig format.
<code>...</code>	For <code>import.gff1</code> , <code>import.gff2</code> and <code>import.gff3</code> : arguments to pass to <code>import.gff</code> . For <code>import.ucsc</code> : arguments to pass on to <code>import.subformat</code> . For the others, arguments to pass to methods.

Value

An instance of [RangedData](#) or one of its subclasses, except for `import.ucsc`, which returns a [RangedDataList](#) instance, unless there is one track and the `drop` parameter is TRUE.

Author(s)

Michael Lawrence

UCSC <http://genome.ucsc.edu/goldenPath/help/customTrack.html>

See Also

[import](#) for the high-level interface to these routines.

Examples

```
# import a GFF V2 file
gff <- import.gff(system.file("tests", "v2.gff", package = "rtracklayer"), version = "2")
# or
gff <- import.gff2(system.file("tests", "v2.gff", package = "rtracklayer"))

# import a WIG file
wig <- import.wig(system.file("tests", "bed.wig", package = "rtracklayer"))
# or
wig <- import.ucsc(system.file("tests", "bed.wig", package = "rtracklayer"),
                  subformat = "wig", drop = TRUE)

# bigWig
## Not run:
bw <- import(system.file("tests", "test.bw", package = "rtracklayer"),
             ranges = IRanges::RangesList(chr19 = IRanges(1, 6e7)))

## End(Not run)
```

sequence<-methods *Load a sequence*

Description

Methods for loading sequences.

Methods

No methods are defined by **rtracklayer** for the sequence(object, ...) <- value generic.

track<-methods *Laying tracks*

Description

Methods for loading [RangedData](#) instances (tracks) into genome browsers.

Usage

```
## S4 method for signature 'BrowserSession,RangedData':
track(object, name = deparse(substitute(track)), view = FALSE, ...) <- value
```

Arguments

object	A BrowserSession into which the track is loaded.
value	The track(s) to load.
name	The name(s) of the track(s) being loaded.
view	Whether to create a view of the track after loading it.
...	Arguments to pass on to methods.

Methods

The following methods are defined by **rtracklayer**. A browser session implementation must implement a method for either [RangedData](#) or [RangedDataList](#). The base [browserSession](#) class will delegate appropriately.

object = "BrowserSession", value = "RangedData" Load this track into the session.

object = "BrowserSession", value = "RangedDataList" Load all tracks into the session.

object = "UCSCSession", value = "RangedDataList" `track(object, name = deparse(substitute(track)), view = FALSE, format = "gff", ...) <- value`: Load the tracks into the session using the specified format. The arguments in ... are passed on to `export.ucsc`, so they could be slots in a [TrackLine](#) subclass or parameters to pass on to the export function for format.

See Also

[track](#) for getting a track from a session.

Examples

```
## Not run:
session <- browserSession()
track <- import(system.file("tests", "v1.gff", package = "rtracklayer"))
track(session, "My Track") <- track

## End(Not run)
```

targets	<i>microRNA target sites</i>
---------	------------------------------

Description

A data frame of human microRNA target sites retrieved from MiRBase. This is a subset of the `hsTargets` data frame in the `microRNA` package. See the `rtracklayer` vignette for more details.

Usage

```
data(targets)
```

Format

A data frame with 2981 observations on the following 6 variables.

`name` The miRBase ID of the microRNA.
`target` The Ensembl ID of the targeted transcript.
`chrom` The name of the chromosome for target site.
`start` Target start position.
`end` Target stop position.
`strand` The strand of the target site, "+", or "-".

Source

The `microRNA` package, dataset `hsTargets`. Originally MiRBase (<http://microrna.sanger.ac.uk/>).

Examples

```
data(targets)
targetTrack <- with(targets,
  GenomicData(IRanges(start, end),
    strand = strand, chrom = chrom))
```

tracks-methods	<i>Accessing track names</i>
----------------	------------------------------

Description

Methods for getting and setting track names.

Methods

The following methods are defined by **rtracklayer** for **getting** track names via the generic `trackNames(object, ...)`.

Get the tracks loaded in the session.

object = "UCSCSession" **object = "UCSCTrackModes"** Get the visible tracks according to the modes (all tracks not set to "hide").

object = "UCSCView" Get the visible tracks in the view.

The following methods are defined by **rtracklayer** for **setting** track names via the generic `trackNames(object) <- value`.

object = "UCSCTrackModes" Sets the tracks that should be visible in the modes. All specified tracks with mode "hide" in `object` are set to mode "full". Any tracks in `object` that are not specified in the value are set to "hide". No other modes are changed.

object = "UCSCView" Sets the visible tracks in the view. This opens a new web browser with only the specified tracks visible.

ucscGenomes

Get available genomes on UCSC

Description

Get a `data.frame` describing the available UCSC genomes.

Usage

```
ucscGenomes()
```

Value

A `data.frame` with the following columns:

<code>db</code>	UCSC DB identifier (e.g. "hg18")
<code>organism</code>	The name of the species (e.g. "Human")
<code>date</code>	The date the genome was built
<code>name</code>	The official name of the genome build

Author(s)

Michael Lawrence

[UCSCSession](#) for details on specifying the genome.

Examples

```
ucscGenomes()
```

UCSCSession-class *Class "UCSCSession"*

Description

An implementation of [BrowserSession](#) for the UCSC genome browser.

Objects from the Class

Objects can be created by calls of the form `browserSession("ucsc", url = "http://genome.ucsc.edu/bin", ...)`. The arguments in `...` correspond to libcurl options, see [getCurlHandle](#). Setting these options may be useful e.g. for getting past a proxy.

Slots

`url`: Object of class "character" holding the base URL of the UCSC browser.

`hguid`: Object of class "numeric" holding the user identification code.

`views`: Object of class "environment" containing a list stored under the name "instances". The list holds the instances of [BrowserView](#) for this session.

Extends

Class "[BrowserSession](#)", directly.

Methods

`browserView(object, range = range(object), track = trackNames(object), ...)`
 Creates a [BrowserView](#) of `range` with visible tracks specified by `track`. `track` may be an instance of [UCSCTrackModes](#). Arguments in `...` should override slots in `range` or else match parameters to a [ucscTrackModes](#) method for creating a [UCSCTrackModes](#) instance that will override modes indicated by the `track` parameter.

`browserViews(object)` Gets the [BrowserView](#) instances for this session.

`range(x)` Gets the [RangesList](#) last displayed in this session.

`genome(x)` Gets the genome identifier of the session, i.e. `genome(range(x))`.

`range(x) <- value` Sets `value`, a [RangesList](#), as the range of session `x`. Note that this setting only lasts until a view is created or manipulated. This mechanism is useful, for example, when treating the UCSC browser as a database, rather than a genome viewer.

`genome(x) <- value` Sets the genome identifier on the range of session `x`.

`getSeq(object, range, track = "Assembly")` Gets the sequence in `range` and `track`.

`track(object, name = names(track), view = TRUE, format = "gff", ...) <- value`
 Loads a track, stored under `name` and formatted as `format`. The arguments in `...` are passed on to `export.ucsc`, so they could be slots in a [TrackLine](#) subclass or parameters to pass on to the export function for `format`.

`track(object, name, range = range(object), table = NULL)` Retrieves a [RangedData](#) with features in `range` from track named `name`. Some built-in tracks have multiple series, each stored in a separate database table. A specific table may be retrieved by passing its name in the `table` parameter. See [tableNames](#) for a way to list the available tables.

`trackNames(object)` Gets the names of the tracks stored in the session.

`ucscTrackModes(object)` Gets the default view modes for the tracks in the session.

Author(s)

Michael Lawrence

See Also

[browserSession](#) for creating instances of this class.

TrackLine-class *Class "TrackLine"*

Description

An object representing a "track line" in the UCSC format. There are two concrete types of track lines: [BasicTrackLine](#) (used for most types of tracks) and [GraphTrackLine](#) (used for graphical tracks). This class only declares the common elements between the two.

Objects from the Class

Objects can be created by calls of the form `new("TrackLine", ...)` or parsed from a character vector track line with `as(text, "TrackLine")`. But note that UCSC only understands one of the subclasses mentioned above.

Slots

name: Object of class "character" specifying the name of the track.
description: Object of class "character" describing the track.
visibility: Object of class "character" indicating the default visible mode of the track, see [UCSCTrackModes](#).
color: Object of class "integer" representing the track color (as from [col2rgb](#)).
priority: Object of class "numeric" specifying the rank of this track.

Methods

as(object, "character") Export line to its string representation.

Author(s)

Michael Lawrence

References

<http://genome.ucsc.edu/goldenPath/help/customTrack.html#TRACK> for the official documentation.

See Also

[BasicTrackLine](#) (used for most types of tracks) and [GraphTrackLine](#) (used for Wiggle/bedGraph tracks).

UCSCTrackModes-class

Class "UCSCTrackModes"

Description

A vector of view modes ("hide", "dense", "full", "pack", "squish") for each track in a UCSC view.

Objects from the Class

Objects may be created by calls of the form `ucscTrackModes(object = character(), hide = character(), dense = character(), pack = character(), squish = character(), full = character())`, where `object` should be a character vector of mode names (with its `names` attribute specifying the corresponding track names). The other parameters should contain track names that override the modes in `object`.

Slots

`.Data`: Object of class "character" holding the modes ("hide", "dense", "full", "pack", "squish"), with its `names` attribute holding corresponding track names.

`labels`: Object of class "character" holding labels (human-readable names) corresponding to each track/mode.

Extends

Class "character", from data part. Class "vector", by class "character", distance 2. Class `characterORMIAME`, by class "character", distance 2.

Methods

`trackNames(object)` Gets the names of the visible tracks (those that do not have mode "hide").

`trackNames(object) <- value` Sets the names of the visible tracks. Any tracks named in `value` are set to "full" if the are currently set to "hide" in this object. Any tracks not in `value` are set to "hide". All other modes are preserved.

`object[i]` Gets the track mode of the tracks indexed by `i`, which can be any type of index supported by character vector subsetting. If `i` is a character vector, it indexes first by the internal track IDs (the `names` on `.Data`) and then by the user-level track names (the `labels` slot).

`object[i] <- value` Sets the track modes indexed by `i` (in the same way as in `object[i]` above) to those specified in `value`.

Author(s)

Michael Lawrence

See Also

`UCSCView` on which track view modes may be set.

 ucscTrackModes-methods

Accessing UCSC track modes

Description

Generics for getting and setting UCSC track visibility modes ("hide", "dense", "full", "pack", "squish").

Methods

The following methods are defined by **rtracklayer** for **getting** the track modes through the generic `ucscTrackModes(object, ...)`.

`function(object, hide = character(), dense = character(), pack = character(), squish = character(), full = character())` Creates an instance of `UCSCTrackModes` from `object`, a character vector of mode names, with the corresponding track ids given in the `names` attribute. Note that `object` can be a `UCSCTrackModes` instance, as `UCSCTrackModes` extends `character`. The other parameters are character vectors identifying the tracks for each mode and overriding the modes specified by `object`.

object = "character" **object = "missing"** The same interface as above, except `object` defaults to an empty character vector.

object = "UCSCView" Gets modes for tracks in the view.

object = "UCSCSession" Gets default modes for the tracks in the session. These are the modes that will be used as the default for a newly created view.

The following methods are defined by **rtracklayer** for **setting** the track modes through the generic `ucscTrackModes(object) <- value`.

object = "UCSCView", value = "UCSCTrackModes" Sets the modes for the tracks in the view.

object = "UCSCView", value = "character" Sets the modes from a character vector of mode names, with the corresponding track names given in the `names` attribute.

See Also

`trackNames` and `trackNames<-` for just getting or setting which tracks are visible (not of mode "hide").

Examples

```
# Tracks "foo" and "bar" are fully shown, "baz" is hidden
modes <- ucscTrackModes(full = c("foo", "bar"), hide = "baz")
# Update the modes to hide track "bar"
modes2 <- ucscTrackModes(modes, hide = "bar")
```

UCSCView-class *Class "UCSCView"*

Description

An object representing a view of a genome in the UCSC browser.

Objects from the Class

Objects are created by calling `browserView(session, ...)` where `session` is a `UCSCSession`.

Slots

`hgscid`: Object of class "numeric", which identifies this view to UCSC.

`session`: Object of class "BrowserSession" to which this view belongs.

Extends

Class "`BrowserView`", directly.

Methods

`activeView(object)` Obtains a logical indicating whether this view is the active view.

`range(object)` Obtains the `RangesList` displayed by this view.

`range(object) <- value` Sets the `RangesList` displayed by this view.

`trackNames(object)` Gets the names of the visible tracks in this view.

`trackNames(object) <- value` Sets the visible tracks by name.

`visible(object)` Get a named logical vector indicating whether each track is visible.

`visible(object) <- value` Set a logical vector indicating the visibility of each track, in the same order as returned by `visible(object)`.

`ucscTrackModes(object)` Obtains the `UCSCTrackModes` for this view.

`ucscTrackModes(object) <- value` Sets the `UCSCTrackModes` for this view. The `value` may be either a `UCSCTrackModes` instance or a character vector that will be coerced by a call to `ucscTrackModes`.

Author(s)

Michael Lawrence

See Also

`browserView` for creating instances of this class.

GraphTrackLine-class

Class "GraphTrackLine"

Description

A UCSC track line for graphical tracks.

Objects from the Class

Objects can be created by calls of the form `new("GraphTrackLine", ...)` or parsed from a character vector track line with `as(text, "GraphTrackLine")` or converted from a [BasicTrackLine](#) using `as(basic, "GraphTrackLine")`.

Slots

altColor: Object of class "integer" giving an alternate color, as from [col2rgb](#).

autoScale: Object of class "logical" indicating whether to automatically scale to min/max of the data.

gridDefault: Object of class "logical" indicating whether a grid should be drawn.

maxHeightPixels: Object of class "numeric" of length three (max, default, min), giving the allowable range for the vertical height of the graph.

graphType: Object of class "character", specifying the graph type, either "bar" or "points".

viewLimits: Object of class "numeric" and of length two specifying the data range (min, max) shown in the graph.

yLineMark: Object of class "numeric" giving the position of a horizontal line.

yLineOnOff: Object of class "logical" indicating whether the `yLineMark` should be visible.

windowingFunction: Object of class "character", one of "maximum", "mean", "minimum", for removing points when the graph shrinks.

smoothingWindow: Object of class "numeric" giving the window size of a smoother to pass over the graph.

type: Scalar "character" indicating the type of the track, either "wig" or "bedGraph".

name: Object of class "character" specifying the name of the track.

description: Object of class "character" describing the track.

visibility: Object of class "character" indicating the default visible mode of the track, see [UCSCTrackModes](#).

color: Object of class "integer" representing the track color (as from [col2rgb](#)).

priority: Object of class "numeric" specifying the rank of this track.

Extends

Class "[TrackLine](#)", directly.

Methods

as(object, "character") Export line to its string representation.

as(object, "BasicTrackLine") Convert this line to a basic UCSC track line, using defaults for slots not held in common.
