

Package ‘CexoR’

April 9, 2015

Version 1.4.0

Date 2014-01-01

Type Package

Title An R package to uncover high-resolution protein-DNA interactions in ChIP-exo replicates

Author Pedro Madrigan <pm12@sanger.ac.uk>

Description Strand specific peak-pair calling in ChIP-exo replicates. The cumulative Skellam distribution function (package 'skellam') is used to detect significant normalized count differences of opposed sign at each DNA strand (peak-pairs). Irreproducible discovery rate for overlapping peak-pairs across biological replicates is estimated using the package 'idr'.

Depends R (>= 2.10.0), S4Vectors, IRanges

Maintainer Pedro Madrigan <pm12@sanger.ac.uk>

Imports Rsamtools, GenomeInfoDb, GenomicRanges, rtracklayer, idr

Suggests RUnit, BiocGenerics, BiocStyle

License Artistic-2.0 | GPL-2 + file LICENSE

LazyLoad yes

LazyData yes

Examples

```
## hg19. chr2:1-1,000,000. CTCF data from Rhee and Pugh (2011)  
owd <- setwd(tempdir())
```

```

rep1 <- "CTCF_rep1_chr2_1-1e6.bam"
rep2 <- "CTCF_rep2_chr2_1-1e6.bam"
rep3 <- "CTCF_rep3_chr2_1-1e6.bam"
r1 <- system.file("extdata", rep1, package="CexoR",mustWork = TRUE)
r2 <- system.file("extdata", rep2, package="CexoR",mustWork = TRUE)
r3 <- system.file("extdata", rep3, package="CexoR",mustWork = TRUE)

cexor(bam=c(r1,r2,r3), chrN="chr2", chrL=1e6, idr=0.01, p=1e-12, N=3e4)

setwd(owd)

```

cexor

*ChIP-exo peak-pair calling with replicates***Description**

ChIP-exo peak-pair calling with replicates.

Usage

```

cexor(bam, chrN, chrL, p=1e-12, dpeaks=c(0,150), dpairs=100, idr=0.01,
N=5e6, bedfile=TRUE)

```

Arguments

bam	BAM alignment files of biological replicates.
chrN	Vector of chromosome names.
chrL	Vector of chromosome sizes (bp).
p	P-value cutoff (should be relaxed to allow the correct estimation of the irreproducible discovery rate (idr). See the vignette for more information.)
dpeaks	Main. and max. allowed distance between peak pairs located at opposed strands in a replicate (bp).
dpairs	Max. allowable distance between peak-pair centres across replicates (bp).
idr	Irreproducible discovery rate cutoff [0-1].
N	Genome is divided in blocks of N bp. for processing. N must be not higher than the size of the smallest chromosome.
bedfile	Generate BED files of ChIP-exo reproducible peak pairs.

Details

Strand specific peak-pair calling in ChIP-exo replicates. The cumulative Skellam distribution function (package 'skellam') is used to detect significant normalized count differences of opposed sign at each DNA strand (peak-pairs). Irreproducible discovery rate for overlapping peak-pairs across biological replicates is estimated using the package 'idr'. The internal functions `pskellam` and `pskellam.sp` from the Jerry W. Lewis' 'skellam' R package (version 0.0-8-7) are used to calculate the cumulative Skellam distribution (see LICENSE file).

Value

A list containing the following elements:

- bindingEvents** A GRanges object with reproducible peak pair locations. The metadata 'value' indicates the Irreproducible discovery rate (IDR) estimated at this region, while 'repI.neg.log10pvalue' indicates $-\log_{10}(\text{p-value})$ for the replicate I. 'Stouffer.pvalue' and 'Fisher.pvalue' report the combined p-value considering they come from independent significance tests.
- bindingCentres** A GRanges object with centre position of reproducible peak pair locations. The metadata 'value' indicates the Irreproducible discovery rate (IDR) estimated at this region, while 'repI.neg.log10pvalue' indicates $-\log_{10}(\text{p-value})$ for the replicate I. 'Stouffer.pvalue' and 'Fisher.pvalue' report the combined p-value considering they come from independent significance tests.
- pairedPeaksRepl**
A GRangesList object with the location of peak pairs retrieved at each replicate. The metadata 'score' indicates $-\log_{10}(\text{p-value})$.
