

Package ‘MatrixGenerics’

October 18, 2022

Title S4 Generic Summary Statistic Functions that Operate on Matrix-Like Objects

Description S4 generic functions modeled after the 'matrixStats' API for alternative matrix implementations. Packages with alternative matrix implementation can depend on this package and implement the generic functions that are defined here for a useful set of row and column summary statistics. Other package developers can import this package and handle a different matrix implementations without worrying about incompatibilities.

MatrixGenerics-package

The MatrixGenerics package

Description

---------	---

Description

Check if all elements in a row (column) of a matrix-like object are equal to a value.

Usage

```
rowAlls(x, rows = NULL, cols = NULL, value = TRUE, na.rm = FALSE, ...,
        useNames = NA)
```

```
## S4 method for signature 'matrix_OR_array_OR_table_OR_numeric'
rowAlls(x, rows = NULL,
        cols = NULL, value = TRUE, na.rm = FALSE, dim. = dim(x), ...,
        useNames = NA)
```

```
## S4 method for signature 'ANY'
rowAlls(x, rows = NULL, cols = NULL, value = TRUE,
        na.rm = FALSE, ..., useNames = NA)
```

```

Details

The S4 methods for x of type [matrix](#), [array](#), or [numeric](#) call `matrixStats::rowRanges` / `matrixStats::colRanges`.

Value

a [numeric](#) Nx2 (Kx2) [matrix](#), where N (K) is the number of rows (columns) for which the ranges are calculated.

Note

Unfortunately for the argument list of the `rowRanges()` generic function we cannot follow the scheme used for the other row/column matrix summarization generic functions. This is because we need to be compatible with the historic `rowRanges()` getter for [RangedSummarizedExperiment](#) objects. See `?SummarizedExperiment::rowRanges`.

See Also

- `matrixStats::rowRanges()` and `matrixStats::colRanges()` which are used when the input is a matrix or numeric vector.
- For max estimates, see `rowMaxs()`.
- For min estimates, see `rowMins()`.

Examples

```

mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)

## S4 method for signature 'matrix_OR_array_OR_table_OR_numeric'

  "max", "min", "dense"), dim. = dim(x), ..., useNames = NA)

  useNames = NA)

## S4 method for signature 'ANY'
colRanks(x, rows = NULL, cols = NULL,
  ties.method = c("max", "average"), ..., useNames = NA)

```

Arguments

<code>x</code>	An <code>NxK</code> matrix-like object.
<code>rows, cols</code>	A vector indicating the subset of rows (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>ties.method</code>	A character string specifying how ties are treated. Note that the default specifies fewer options than the original <code>matrixStats</code> package.
<code>...</code>	Additional arguments passed to specific methods.
<code>useNames</code>	If <code>NA</code> , the default behavior of the function about naming support is remained. If <code>FALSE</code> , no naming support is done. Else if <code>TRUE</code> , names attributes of result are set.
<code>dim.</code>	An integer vector of length two specifying the dimension of <code>x</code> , essential when <code>x</code> is a numeric vector. Note, that this is not a generic argument and not all methods need provide it.
<code>preserveShape</code>	If <code>TRUE</code> the output matrix has the same shape as the input <code>x</code> . Note, that this is not a generic argument and not all implementation of this function have to provide it.

Details

The S4 methods for `x` of type `matrix`, `array`, or `numeric` call `matrixStats::rowRanks / matrixStats::colRanks`.

The `matrixStats::rowRanks()` function can handle a lot of different values for the `ties.method` argument. Users of the generic function should however only rely on `max` and `average` because the other ones are not guaranteed to be implemented:

`max` for values with identical values the maximum rank is returned

`average` for values with identical values the average of the ranks they cover is returned. Note, that in this case the return value is of type `numeric`.

Value

a matrix of type `integer` is returned unless `ties.method = "average"`. It has dimensions `NxJ` (`KxJ`) `matrix`, where `N` (`K`) is the number of rows (columns) of the input `x`.

See Also

- `matrixStats::rowRanks()` and `matrixStats::colRanks()` which are used when the input is a `matrix` or `numeric` vector.
- `base::rank`

Examples

```
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)

- dim. An `integer vector` of length two specifying the dimension of `x`, essential when `x` is a `numeric` vector. Note, that this is not a generic argument and not all methods need provide it.

Details

The S4 methods for `x` of type `matrix`, `array`, or `numeric` call `matrixStats::rowVars/matrixStats::colVars`.

Value

Returns a `numeric vector` of length `N (K)`.

See Also

- `matrixStats::rowVars()` and `matrixStats::colVars()` which are used when the input is a `matrix` or `numeric` vector.
- For mean estimates, see `rowMeans2()` and `rowMeans()`.
- For standard deviation estimates, see `rowSds()`.
- `stats::var()`.

```
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
