

Package ‘DelayedMatrixStats’

October 15, 2018

Type Package

Title Functions that Apply to Rows and Columns of 'DelayedMatrix' Objects

Version 1.2.0

Author Peter Hickey <peter.hickey@gmail.com>

Maintainer Peter Hickey <peter.hickey@gmail.com>

Description A port of the 'matrixStats' API for use with DelayedMatrix objects from the 'DelayedArray' package. High-performing functions operating on rows and columns of DelayedMatrix objects, e.g. col / rowMedians(), col / rowRanks(), and col / rowSds(). Functions optimized per data type and for subsetted calculations such that both memory usage and processing time is minimized.

colAlls	<i>Checks if a value exists / does not exist in each row (column) of a matrix</i>
---------	---

Description

Checks if a value exists / does not exist in each row (column) of a matrix.

Usage

```
colAlls(x, rows = NULL, cols = NULL, value = TRUE, na.rm = FALSE,
        dim. = dim(x), ...)
```

```
colAnys(x, rows = NULL, cols = NULL, value = TRUE, na.rm = FALSE,
        dim. = dim(x), ...)
```

```
rowAlls(x, rows = NULL, cols = NULL, value = TRUE, na.rm = FALSE,
        dim. = dim(x), ...)
```

```
rowAnys(x, rows = NULL, cols = NULL, value = TRUE, na.rm = FALSE,
        dim. = dim(x), ...)
```

```
## S4 method for signature 'DelayedMatrix'
colAlls(x, rows = NULL, cols = NULL,
        value = TRUE, na.rm = FALSE, dim. = dim(x),
        force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
colAnys(x, rows = NULL, cols = NULL,
        value = TRUE, na.rm = FALSE, dim. = dim(x),
        force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowAlls(x, rows = NULL, cols = NULL,
        value = TRUE, na.rm = FALSE, dim. = dim(x),
        force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowAnys(x, rows = NULL, cols = NULL,
        value = TRUE, na.rm = FALSE, dim. = dim(x),
        force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
cols	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
value	A value to search for.
na.rm	If <code>TRUE</code> , <code>NA</code> s are excluded first, otherwise not.
dim.	An integer vector of length two specifying the dimension of x, also when not a matrix .
...	Additional arguments passed to specific methods.
force_block_processing	<code>FALSE</code> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <code>TRUE</code> (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary <code>base::array</code> .

Details

These functions takes either a matrix or a vector as input. If a vector, then argument `dim.` must be specified and fulfill `prod(dim.) == length(x)`. The result will be identical to the results obtained when passing `matrix(x, nrow = dim.[1L], ncol = dim.[2L])`, but avoids having to temporarily create/allocate a matrix, if only such is needed only for these calculations.

Value

`rowAlls()` (`colAlls()`) returns an [logical vector](#) of length N (K). Analogously for `rowAnys()` (`rowAlls()`).

Logical value

When value is logical, the result is as if the function is applied on `as.logical(x)`. More specifically, if `x` is numeric, then all zeros are treated as FALSE, non-zero values as TRUE, and all missing values as NA.

When value is logical, the result is as if the function is applied on `as.logical(x)`. More specifically, if `x` is numeric, then all zeros are treated as FALSE, non-zero values as TRUE, and all missing values as NA.

`rowCounts`

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'SolidRleArraySeed' seed
dm_rle <- RleArray(Rle(c(rep(1L, 5),
                        as.integer((0:4) ^ 2),
                        seq(-5L, -1L, 1L))),
                  dim = c(5, 3))

colAlls(dm_matrix, value = 1)
colAnys(dm_matrix, value = 2)
rowAlls(dm_rle, value = 1)
rowAnys(dm_rle, value = 2)
```

colAnyMissings

Checks if there are any missing values in an object or not

Description

Checks if there are any missing values in an object or not. *Please use `base::anyNA()` instead of `anyMissing()`, `colAnyNAs()` instead of `colAnyMissings()`, and `rowAnyNAs()` instead of `rowAnyMissings()`.*

Usage

```
colAnyMissings(x, rows = NULL, cols = NULL, ...)

colAnyNAs(x, rows = NULL, cols = NULL, ...)

rowAnyMissings(x, rows = NULL, cols = NULL, ...)

rowAnyNAs(x, rows = NULL, cols = NULL, ...)

## S4 method for signature 'DelayedMatrix'
colAnyMissings(x, rows = NULL, cols = NULL,
               force_block_processing = FALSE, ...)
```

```
## S4 method for signature 'DelayedMatrix'
colAnyNAs(x, rows = NULL, cols = NULL,
  force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowAnyMissings(x, rows = NULL, cols = NULL,
  force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowAnyNAs(x, rows = NULL, cols = NULL,
  force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of elements (or rows and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of elements (or rows and/or columns) to operate over. If NULL , no subsetting is done.
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Details

The implementation of this method is optimized for both speed and memory. The method will return [TRUE](#) as soon as a missing value is detected.

Value

Returns [TRUE](#) if a missing value was detected, otherwise [FALSE](#).

See Also

Starting with R v3.1.0, there is `anyNA()` in the [base](#), which provides the same functionality as `anyMissing()`.

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
  as.integer((0:4) ^ 2),
  seq(-5L, -1L, 1L)),
  ncol = 3))

# A DelayedMatrix with a 'HDF5ArraySeed' seed
# NOTE: Requires that the HDF5Array package is installed
library(HDF5Array)
dm_HDF5 <- writeHDF5Array(matrix(c(rep(1L, 5),
  as.integer((0:4) ^ 2),
```

```

                                seq(-5L, -1L, 1L)),
                                ncol = 3))

dm_matrix[dm_matrix > 3] <- NA
colAnyNAs(dm_matrix)
dm_HDF5[dm_HDF5 > 3] <- NA
rowAnyNAs(dm_HDF5)

```

colAvsPerRowSet	<i>Applies a row-by-row (column-by-column) averaging function to equally-sized subsets of matrix columns (rows)</i>
-----------------	---

Description

Applies a row-by-row (column-by-column) averaging function to equally-sized subsets of matrix columns (rows). Each subset is averaged independently of the others.

Usage

```

colAvsPerRowSet(X, W = NULL, cols = NULL, S, FUN = colMeans, ...,
               tFUN = FALSE)

rowAvsPerColSet(X, W = NULL, rows = NULL, S, FUN = rowMeans, ...,
               tFUN = FALSE)

## S4 method for signature 'DelayedMatrix'
colAvsPerRowSet(X, W = NULL, cols = NULL, S,
               FUN = colMeans, ..., force_block_processing = FALSE, tFUN = FALSE)

## S4 method for signature 'DelayedMatrix'
rowAvsPerColSet(X, W = NULL, rows = NULL, S,
               FUN = rowMeans, ..., force_block_processing = FALSE, tFUN = FALSE)

```

Arguments

X	A NxM DelayedMatrix .
W	An optional numeric NxM matrix of weights.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
S	An integer KxJ matrix specifying the J subsets. Each column holds K column (row) indices for the corresponding subset.
FUN	The row-by-row (column-by-column) function used to average over each subset of X. This function must accept a numeric NxK (KxM) matrix and the logical argument <code>na.rm</code> (which is automatically set), and return a numeric vector of length N (M).
...	Additional arguments passed to specific methods.
tFUN	If TRUE , the NxK (KxM) matrix passed to FUN() is transposed first.
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.

force_block_processing

FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on `getOption("DelayedArray.block.size")`) columns (`colFoo()`) or rows (`rowFoo()`) into memory as an ordinary `base::array`.

Details

If argument `S` is a single column vector with indices `1:N`, then `rowAvsPerColSet(X, S = S, FUN = rowMeans)` gives the same result as `rowMeans(X)`. Analogously, for `rowAvsPerColSet()`.

Value

Returns a numeric $J \times N$ ($M \times J$) matrix, where row names equal `rownames(X)` (`colnames(S)`) and column names `colnames(S)` (`colnames(X)`).

Examples

```
# A DelayedMatrix with a 'DataFrame' seed
dm_DF <- DelayedArray(S4Vectors::DataFrame(C1 = rep(1L, 5),
                                           C2 = as.integer((0:4) ^ 2),
                                           C3 = seq(-5L, -1L, 1L)))

colAvsPerRowSet(dm_DF, S = matrix(1:2, ncol = 2))

rowAvsPerColSet(dm_DF, S = matrix(1:2, ncol = 1))
```

colCollapse

Extracts one cell per row (column) from a matrix

Description

Extracts one cell per row (column) from a matrix. The implementation is optimized for memory and speed.

Usage

```
colCollapse(x, idxs, cols = NULL, dim. = dim(x), ...)

rowCollapse(x, idxs, rows = NULL, dim. = dim(x), ...)

## S4 method for signature 'DelayedMatrix'
colCollapse(x, idxs, cols = NULL, dim. = dim(x),
           force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowCollapse(x, idxs, rows = NULL, dim. = dim(x),
           force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
idxs	An index vector of (maximum) length N (K) specifying the columns (rows) to be extracted.
cols	A vector indicating subset of rows (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
dim.	An integer vector of length two specifying the dimension of x, also when not a matrix .
...	Additional arguments passed to specific methods.
rows	A vector indicating subset of rows (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary <code>base::array</code> .

Value

Returns a [vector](#) of length N (K).

See Also

Matrix indexing to index elements in matrices and arrays, cf. [\[\]](#).

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'HDF5ArraySeed' seed
# NOTE: Requires that the HDF5Array package is installed
library(HDF5Array)
dm_HDF5 <- writeHDF5Array(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# Extract the 4th row as a vector
# NOTE: An ordinary vector is returned regardless of the backend of
#       the DelayedMatrix object
colCollapse(dm_matrix, 4)
colCollapse(dm_HDF5, 4)

# Extract the 2nd column as a vector
# NOTE: An ordinary vector is returned regardless of the backend of
#       the DelayedMatrix object
rowCollapse(dm_matrix, 2)
rowCollapse(dm_HDF5, 2)
```

colCounts

*Counts the number of occurrences of a specific value***Description**

The row- and column-wise functions take either a matrix or a vector as input. If a vector, then argument `dim.` must be specified and fulfill `prod(dim.) == length(x)`. The result will be identical to the results obtained when passing `matrix(x, nrow = dim.[1L], ncol = dim.[2L])`, but avoids having to temporarily create/allocate a matrix, if only such is needed only for these calculations.

Usage

```
colCounts(x, rows = NULL, cols = NULL, value = TRUE, na.rm = FALSE,
  dim. = dim(x), ...)
```

```
rowCounts(x, rows = NULL, cols = NULL, value = TRUE, na.rm = FALSE,
  dim. = dim(x), ...)
```

```
## S4 method for signature 'DelayedMatrix'
colCounts(x, rows = NULL, cols = NULL,
  value = TRUE, na.rm = FALSE, dim. = dim(x),
  force_block_processing = FALSE, ...)
```

```
## S4 method for signature 'DelayedMatrix'
rowCounts(x, rows = NULL, cols = NULL,
  value = TRUE, na.rm = FALSE, dim. = dim(x),
  force_block_processing = FALSE, ...)
```

Arguments

<code>x</code>	A $N \times K$ DelayedMatrix .
<code>rows</code>	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>cols</code>	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>value</code>	A value to search for.
<code>na.rm</code>	If <code>TRUE</code> , <code>NA</code> s are excluded first, otherwise not.
<code>dim.</code>	An integer vector of length two specifying the dimension of <code>x</code> , also when not a matrix .
<code>...</code>	Additional arguments passed to specific methods.
<code>force_block_processing</code>	<code>FALSE</code> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <code>TRUE</code> (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary <code>base::array</code> .

Value

rowCounts() (colCounts()) returns an **integer vector** of length N (K). count() returns a scalar of type **integer** if the count is less than $2^{31}-1$ (= .Machine\$integer.max) otherwise a scalar of type **double**.

rowAlls

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'DataFrame' seed
dm_DF <- DelayedArray(S4Vectors::DataFrame(C1 = rep(1L, 5),
                                           C2 = as.integer((0:4) ^ 2),
                                           C3 = seq(-5L, -1L, 1L)))

colCounts(dm_matrix, value = 1)
# Only count those in the first 4 rows
colCounts(dm_matrix, rows = 1:4, value = 1)

rowCounts(dm_DF, value = 5)
# Only count those in the odd-numbered rows of the 2nd column
rowCounts(dm_DF, rows = seq(1, nrow(dm_DF), 2), cols = 2, value = 5)
```

colCummaxs

Cumulative sums, products, minima and maxima for each row (column) in a matrix

Description

Cumulative sums, products, minima and maxima for each row (column) in a matrix.

Usage

```
colCummaxs(x, rows = NULL, cols = NULL, dim. = dim(x), ...)
colCummins(x, rows = NULL, cols = NULL, dim. = dim(x), ...)
colCumprods(x, rows = NULL, cols = NULL, dim. = dim(x), ...)
colCumsums(x, rows = NULL, cols = NULL, dim. = dim(x), ...)
rowCummaxs(x, rows = NULL, cols = NULL, dim. = dim(x), ...)
rowCummins(x, rows = NULL, cols = NULL, dim. = dim(x), ...)
rowCumprods(x, rows = NULL, cols = NULL, dim. = dim(x), ...)
```

```

rowCumsums(x, rows = NULL, cols = NULL, dim. = dim(x), ...)

## S4 method for signature 'DelayedMatrix'
colCummaxs(x, rows = NULL, cols = NULL,
  dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
colCummins(x, rows = NULL, cols = NULL,
  dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
colCumprods(x, rows = NULL, cols = NULL,
  dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
colCumsums(x, rows = NULL, cols = NULL,
  dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowCummaxs(x, rows = NULL, cols = NULL,
  dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowCummins(x, rows = NULL, cols = NULL,
  dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowCumprods(x, rows = NULL, cols = NULL,
  dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowCumsums(x, rows = NULL, cols = NULL,
  dim. = dim(x), force_block_processing = FALSE, ...)

```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of elements (or rows and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of elements (or rows and/or columns) to operate over. If NULL , no subsetting is done.
dim.	An integer vector of length two specifying the dimension of x, also when not a matrix .
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Value

Returns a `numeric` $N \times K$ `matrix` of the same mode as `x`.

See Also

See `cumsum()`, `cumprod()`, `cummin()`, and `cummax()`.

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

colCummaxs(dm_matrix)

colCummins(dm_matrix)

colCumprods(dm_matrix)

colCumsums(dm_matrix)

# Only use rows 2-4
rowCummaxs(dm_Matrix, rows = 2:4)

# Only use rows 2-4
rowCummins(dm_Matrix, rows = 2:4)

# Only use rows 2-4
rowCumprods(dm_Matrix, rows = 2:4)

# Only use rows 2-4
rowCumsums(dm_Matrix, rows = 2:4)
```

colDiffs

Calculates difference for each row (column) in a matrix

Description

Calculates difference for each row (column) in a matrix.

Usage

```
colDiffs(x, rows = NULL, cols = NULL, lag = 1L, differences = 1L,
        dim. = dim(x), ...)
```

```
rowDiffs(x, rows = NULL, cols = NULL, lag = 1L, differences = 1L,
```

```

dim. = dim(x), ...)

## S4 method for signature 'DelayedMatrix'
colDiffs(x, rows = NULL, cols = NULL, lag = 1L,
         differences = 1L, dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowDiffs(x, rows = NULL, cols = NULL, lag = 1L,
         differences = 1L, dim. = dim(x), force_block_processing = FALSE, ...)

```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
lag	An integer specifying the lag.
differences	An integer specifying the order of difference.
dim.	An integer vector of length two specifying the dimension of x, also when not a matrix .
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Value

Returns a [numeric](#) Nx(K-1) or (N-1)xK [matrix](#).

See Also

See also [diff2\(\)](#).

Examples

```

# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                              ncol = 3))

# A DelayedMatrix with a 'HDF5ArraySeed' seed
# NOTE: Requires that the HDF5Array package is installed
library(HDF5Array)
dm_HDF5 <- writeHDF5Array(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                              ncol = 3))

```

rowDiffs(dm_HDF5)
# In reverse column order
rowDiffs(dm_HDF5, cols = seq(ncol(dm_HDF5), 1, -1))
```

colIQRDiffs

Estimation of scale based on sequential-order differences

Description

Estimation of scale based on sequential-order differences, corresponding to the scale estimates provided by [var](#), [sd](#), [mad](#) and [IQR](#).

Usage

```
colIQRDiffs(x, rows = NULL, cols = NULL, na.rm = FALSE, diff = 1L,
  trim = 0, ...)

colMadDiffs(x, rows = NULL, cols = NULL, na.rm = FALSE, diff = 1L,
  trim = 0, ...)

colSdDiffs(x, rows = NULL, cols = NULL, na.rm = FALSE, diff = 1L,
  trim = 0, ...)

colVarDiffs(x, rows = NULL, cols = NULL, na.rm = FALSE, diff = 1L,
  trim = 0, ...)

rowIQRDiffs(x, rows = NULL, cols = NULL, na.rm = FALSE, diff = 1L,
  trim = 0, ...)

rowMadDiffs(x, rows = NULL, cols = NULL, na.rm = FALSE, diff = 1L,
  trim = 0, ...)

rowSdDiffs(x, rows = NULL, cols = NULL, na.rm = FALSE, diff = 1L,
  trim = 0, ...)

rowVarDiffs(x, rows = NULL, cols = NULL, na.rm = FALSE, diff = 1L,
  trim = 0, ...)

## S4 method for signature 'DelayedMatrix'
colIQRDiffs(x, rows = NULL, cols = NULL,
  na.rm = FALSE, diff = 1L, trim = 0, force_block_processing = FALSE,
  ...)

## S4 method for signature 'DelayedMatrix'
colMadDiffs(x, rows = NULL, cols = NULL,
  na.rm = FALSE, diff = 1L, trim = 0, force_block_processing = FALSE,
  ...)

## S4 method for signature 'DelayedMatrix'
```

```

colSdDiffs(x, rows = NULL, cols = NULL,
  na.rm = FALSE, diff = 1L, trim = 0, force_block_processing = FALSE,
  ...)

## S4 method for signature 'DelayedMatrix'
colVarDiffs(x, rows = NULL, cols = NULL,
  na.rm = FALSE, diff = 1L, trim = 0, force_block_processing = FALSE,
  ...)

## S4 method for signature 'DelayedMatrix'
rowIQRDiffs(x, rows = NULL, cols = NULL,
  na.rm = FALSE, diff = 1L, trim = 0, force_block_processing = FALSE,
  ...)

## S4 method for signature 'DelayedMatrix'
rowMadDiffs(x, rows = NULL, cols = NULL,
  na.rm = FALSE, diff = 1L, trim = 0, force_block_processing = FALSE,
  ...)

## S4 method for signature 'DelayedMatrix'
rowSdDiffs(x, rows = NULL, cols = NULL,
  na.rm = FALSE, diff = 1L, trim = 0, force_block_processing = FALSE,
  ...)

## S4 method for signature 'DelayedMatrix'
rowVarDiffs(x, rows = NULL, cols = NULL,
  na.rm = FALSE, diff = 1L, trim = 0, force_block_processing = FALSE,
  ...)

```

Arguments

<code>x</code>	A $N \times K$ DelayedMatrix .
<code>rows</code>	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>cols</code>	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>na.rm</code>	If <code>TRUE</code> , <code>NA</code> s are excluded, otherwise not.
<code>diff</code>	The positional distance of elements for which the difference should be calculated.
<code>trim</code>	A double in $[0, 1/2]$ specifying the fraction of observations to be trimmed from each end of (sorted) <code>x</code> before estimation.
<code>...</code>	Additional arguments passed to specific methods.
<code>force_block_processing</code>	<code>FALSE</code> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <code>TRUE</code> (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary <code>base::array</code> .

Details

Note that n-order difference MAD estimates, just like the ordinary MAD estimate by `mad`, apply a correction factor such that the estimates are consistent with the standard deviation under Gaussian distributions.

The interquartile range (IQR) estimates does *not* apply such a correction factor. If asymptotically normal consistency is wanted, the correction factor for IQR estimate is $1 / (2 * \text{qnorm}(3/4))$, which is half of that used for MAD estimates, which is $1 / \text{qnorm}(3/4)$. This correction factor needs to be applied manually, i.e. there is no constant argument for the IQR functions.

Value

Returns a `numeric vector` of length 1, length N, or length K.

References

[1] J. von Neumann et al., *The mean square successive difference*. Annals of Mathematical Statistics, 1941, 12, 153-162.

See Also

For the corresponding non-differentiated estimates, see `var`, `sd`, `mad` and `IQR`. Internally, `diff2()` is used which is a faster version of `diff()`.

Examples

```
# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                         as.integer((0:4) ^ 2),
                                         seq(-5L, -1L, 1L)),
                                         ncol = 3))

# A DelayedMatrix with a 'SolidRleArraySeed' seed
dm_Rle <- RleArray(Rle(c(rep(1L, 5),
                        as.integer((0:4) ^ 2),
                        seq(-5L, -1L, 1L))),
                  dim = c(5, 3))

colIQRs	<i>Estimates of the interquartile range for each row (column) in a matrix</i>
---------	---

Description

Estimates of the interquartile range for each row (column) in a matrix.

Usage

```
colIQRs(x, rows = NULL, cols = NULL, na.rm = FALSE, ...)
```

```
rowIQRs(x, rows = NULL, cols = NULL, na.rm = FALSE, ...)
```

```
## S4 method for signature 'DelayedMatrix'
colIQRs(x, rows = NULL, cols = NULL,
        na.rm = FALSE, force_block_processing = FALSE, ...)
```

```
## S4 method for signature 'DelayedMatrix'
rowIQRs(x, rows = NULL, cols = NULL,
        na.rm = FALSE, force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
cols	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
na.rm	If <code>TRUE</code> , missing values are dropped first, otherwise not.
...	Additional arguments passed to specific methods.
force_block_processing	<code>FALSE</code> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <code>TRUE</code> (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary <code>base::array</code> .

Value

Returns a [numeric vector](#) of length N (K).

Missing values

Contrary to [IQR](#), which gives an error if there are missing values and `na.rm = FALSE`, `iqr()` and its corresponding row and column-specific functions return `NA_real_`.

See Also

See [IQR](#). See [rowSds\(\)](#).

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

colIQRs(dm_matrix)

# Only using rows 2-4
rowIQRs(dm_matrix, rows = 2:4)
```

colLogSumExps	<i>Accurately computes the logarithm of the sum of exponentials across rows or columns</i>
---------------	--

Description

Accurately computes the logarithm of the sum of exponentials across rows or columns.

Usage

```
colLogSumExps(lx, rows = NULL, cols = NULL, na.rm = FALSE,
              dim. = dim(lx), ...)

rowLogSumExps(lx, rows = NULL, cols = NULL, na.rm = FALSE,
              dim. = dim(lx), ...)

## S4 method for signature 'DelayedMatrix'
colLogSumExps(lx, rows = NULL, cols = NULL,
              na.rm = FALSE, dim. = dim(lx), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowLogSumExps(lx, rows = NULL, cols = NULL,
              na.rm = FALSE, dim. = dim(lx), force_block_processing = FALSE, ...)
```

Arguments

lx	A NxK DelayedMatrix . Typically, lx are $\log(x)$ values.
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
na.rm	If TRUE , any missing values are ignored, otherwise not.
dim.	An integer vector of length two specifying the dimension of x, also when not a matrix .

... Additional arguments passed to specific methods.

`force_block_processing`
 FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on `getOption("DelayedArray.block.size")`) columns (`colFoo()`) or rows (`rowFoo()`) into memory as an ordinary `base::array`.

Value

A numeric vector of length N (K).

Benchmarking

These methods are implemented in native code and have been optimized for speed and memory.

See Also

To calculate the same on vectors, [logSumExp\(\)](#).

Examples

```
x <- DelayedArray(matrix(runif(10), ncol = 2))
colLogSumExps(log(x))
rowLogSumExps(log(x))
```

<code>colMads</code>	<i>Standard deviation estimates for each row (column) in a matrix</i>
----------------------	---

Description

Standard deviation estimates for each row (column) in a matrix.

Usage

```
colMads(x, rows = NULL, cols = NULL, center = NULL, constant = 1.4826,
        na.rm = FALSE, dim. = dim(x), ...)

colSds(x, rows = NULL, cols = NULL, na.rm = FALSE, center = NULL,
        dim. = dim(x), ...)

rowMads(x, rows = NULL, cols = NULL, center = NULL, constant = 1.4826,
        na.rm = FALSE, dim. = dim(x), ...)

rowSds(x, rows = NULL, cols = NULL, na.rm = FALSE, center = NULL,
        dim. = dim(x), ...)

## S4 method for signature 'DelayedMatrix'
colMads(x, rows = NULL, cols = NULL,
        center = NULL, constant = 1.4826, na.rm = FALSE, dim. = dim(x),
        force_block_processing = FALSE, ...)
```

```
## S4 method for signature 'DelayedMatrix'
colSds(x, rows = NULL, cols = NULL,
       na.rm = FALSE, center = NULL, dim. = dim(x),
       force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowMads(x, rows = NULL, cols = NULL,
        center = NULL, constant = 1.4826, na.rm = FALSE, dim. = dim(x),
        force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowSds(x, rows = NULL, cols = NULL,
       na.rm = FALSE, center = NULL, dim. = dim(x),
       force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
center	(optional) The center, defaults to the row means for the SD estimators and row medians for the MAD estimators.
constant	A scale factor. See mad for details.
na.rm	If TRUE , NAs are excluded first, otherwise not.
dim.	An integer vector of length two specifying the dimension of x, also when not a matrix .
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Value

Returns a [numeric vector](#) of length N (K).

See Also

Examples

```
# A DelayedMatrix with a 'data.frame' seed
dm_df <- DelayedArray(data.frame(C1 = rep(1L, 5),
                                C2 = as.integer((0:4) ^ 2),
                                C3 = seq(-5L, -1L, 1L)))

# A DelayedMatrix with a 'DataFrame' seed
```

```
dm_DF <- DelayedArray(S4Vectors::DataFrame(C1 = rep(1L, 5),
                                           C2 = as.integer((0:4) ^ 2),
                                           C3 = seq(-5L, -1L, 1L)))

colMads(dm_df)

colSds(dm_df)

rowMads(dm_DF)

rowSds(dm_DF)
```

colMeans2

*Calculates the mean for each row (column) in a matrix***Description**

Calculates the mean for each row (column) in a matrix.

Usage

```
colMeans2(x, rows = NULL, cols = NULL, na.rm = FALSE, dim. = dim(x),
          ...)

rowMeans2(x, rows = NULL, cols = NULL, na.rm = FALSE, dim. = dim(x),
          ...)

## S4 method for signature 'DelayedMatrix'
colMeans2(x, rows = NULL, cols = NULL,
          na.rm = FALSE, dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'Matrix'
colMeans2(x, rows = NULL, cols = NULL, na.rm = FALSE,
          dim. = dim(x), ...)

## S4 method for signature 'SolidRleArraySeed'
colMeans2(x, rows = NULL, cols = NULL,
          na.rm = FALSE, dim. = dim(x), ...)

## S4 method for signature 'DelayedMatrix'
rowMeans2(x, rows = NULL, cols = NULL,
          na.rm = FALSE, dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'Matrix'
rowMeans2(x, rows = NULL, cols = NULL, na.rm = FALSE,
          dim. = dim(x), ...)
```

Arguments

x A NxK [DelayedMatrix](#).

rows A [vector](#) indicating subset of rows (and/or columns) to operate over. If [NULL](#), no subsetting is done.

cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
na.rm	If TRUE , NA s are excluded first, otherwise not.
dim.	An integer vector of length two specifying the dimension of x, also when not a matrix .
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Details

The implementation of `rowMeans2()` and `colMeans2()` is optimized for both speed and memory.

Value

Returns a **numeric vector** of length N (K).

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'SolidRleArraySeed' seed
dm_rle <- RleArray(Rle(c(rep(1L, 5),
                        as.integer((0:4) ^ 2),
                        seq(-5L, -1L, 1L))),
                  dim = c(5, 3))

colMeans2(dm_matrix)

# NOTE: Temporarily use verbose output to demonstrate which method is
#       which method is being used
options(DelayedMatrixStats.verbose = TRUE)
# By default, this uses a seed-aware method for a DelayedMatrix with a
# 'SolidRleArraySeed' seed
rowMeans2(dm_rle)
# Alternatively, can use the block-processing strategy
rowMeans2(dm_rle, force_block_processing = TRUE)
options(DelayedMatrixStats.verbose = FALSE)
```

colMedians

Calculates the median for each row (column) in a matrix

Description

Calculates the median for each row (column) in a matrix.

Usage

```
colMedians(x, rows = NULL, cols = NULL, na.rm = FALSE, dim. = dim(x),
  ...)

rowMedians(x, rows = NULL, cols = NULL, na.rm = FALSE, dim. = dim(x),
  ...)

## S4 method for signature 'DelayedMatrix'
colMedians(x, rows = NULL, cols = NULL,
  na.rm = FALSE, dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowMedians(x, rows = NULL, cols = NULL,
  na.rm = FALSE, dim. = dim(x), force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
na.rm	If TRUE , NAs are excluded first, otherwise not.
dim.	An integer vector of length two specifying the dimension of x, also when not a matrix .
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Details

The implementation of `rowMedians()` and `colMedians()` is optimized for both speed and memory. To avoid coercing to [doubles](#) (and hence memory allocation), there is a special implementation for [integer](#) matrices. That is, if x is an [integer matrix](#), then `rowMedians(as.double(x))` (`rowMedians(as.double(x))`) would require three times the memory of `rowMedians(x)` (`colMedians(x)`), but all this is avoided.

Value

Returns a [numeric vector](#) of length N (K).

See Also

See [rowWeightedMedians\(\)](#) and [colWeightedMedians\(\)](#) for weighted medians. For mean estimates, see [rowMeans2\(\)](#) and [rowMeans\(\)](#).

Examples

```
# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

colMedians(dm_Matrix)

rowMedians(dm_Matrix)
```

<code>colOrderStats</code>	<i>Gets an order statistic for each row (column) in a matrix</i>
----------------------------	--

Description

Gets an order statistic for each row (column) in a matrix.

Usage

```
colOrderStats(x, rows = NULL, cols = NULL, which, dim. = dim(x), ...)

rowOrderStats(x, rows = NULL, cols = NULL, which, dim. = dim(x), ...)

## S4 method for signature 'DelayedMatrix'
colOrderStats(x, rows = NULL, cols = NULL, which,
              dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowOrderStats(x, rows = NULL, cols = NULL, which,
              dim. = dim(x), force_block_processing = FALSE, ...)
```

Arguments

<code>x</code>	A <code>NxK</code> DelayedMatrix .
<code>rows</code>	A vector indicating subset of rows (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>cols</code>	A vector indicating subset of rows (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>which</code>	An integer index in <code>[1,K]</code> (<code>[1,N]</code>) indicating which order statistic to be returned.
<code>dim.</code>	An integer vector of length two specifying the dimension of <code>x</code> , also when not a matrix .
<code>...</code>	Additional arguments passed to specific methods.
<code>force_block_processing</code>	<code>FALSE</code> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <code>TRUE</code> (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Details

The implementation of `rowOrderStats()` is optimized for both speed and memory. To avoid coercing to `doubles` (and hence memory allocation), there is a unique implementation for `integer` matrices.

Value

Returns a `numeric vector` of length `N (K)`.

Missing values

This method does *not* handle missing values, that is, the result corresponds to having `na.rm = FALSE` (if such an argument would be available).

See Also

See `rowMeans()` in `colSums()`.

Examples

```
# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                         as.integer((0:4) ^ 2),
                                         seq(-5L, -1L, 1L)),
                                         ncol = 3))

# Only using columns 2-3
colOrderStats(dm_Matrix, cols = 2:3, which = 1)

# Different algorithms, specified by `which`, may give different results
rowOrderStats(dm_Matrix, which = 1)
rowOrderStats(dm_Matrix, which = 2)
```

colProds

Calculates the product for each row (column) in a matrix

Description

Calculates the product for each row (column) in a matrix.

Usage

```
colProds(x, rows = NULL, cols = NULL, na.rm = FALSE,
         method = c("direct", "expSumLog"), ...)

rowProds(x, rows = NULL, cols = NULL, na.rm = FALSE,
         method = c("direct", "expSumLog"), ...)

## S4 method for signature 'DelayedMatrix'
colProds(x, rows = NULL, cols = NULL,
         na.rm = FALSE, method = c("direct", "expSumLog"),
         force_block_processing = FALSE, ...)
```

```
## S4 method for signature 'SolidRleArraySeed'
colProds(x, rows = NULL, cols = NULL,
  na.rm = FALSE, method = c("direct", "expSumLog"), ...)

## S4 method for signature 'DelayedMatrix'
rowProds(x, rows = NULL, cols = NULL,
  na.rm = FALSE, method = c("direct", "expSumLog"),
  force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of elements (or rows and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of elements (or rows and/or columns) to operate over. If NULL , no subsetting is done.
na.rm	If TRUE , missing values are ignored, otherwise not.
method	A character string specifying how each product is calculated.
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Details

If `method = "expSumLog"`, then then `product()` function is used, which calculates the produce via the logarithmic transform (treating negative values specially). This improves the precision and lowers the risk for numeric overflow. If `method = "direct"`, the direct product is calculated via the `prod()` function.

Value

Returns a [numeric vector](#) of length N (K).

Missing values

Note, if `method = "expSumLog"`, `na.rm = FALSE`, and `x` contains missing values ([NA](#) or [NaN](#)), then the calculated value is also missing value. Note that it depends on platform whether [NaN](#) or [NA](#) is returned when an [NaN](#) exists, cf. `is.nan()`.

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
  as.integer((0:4) ^ 2),
  seq(-5L, -1L, 1L)),
  ncol = 3))

# A DelayedMatrix with a 'HDF5ArraySeed' seed
# NOTE: Requires that the HDF5Array package is installed
```

```

library(HDF5Array)
dm_HDF5 <- writeHDF5Array(matrix(c(rep(1L, 5),
                                   as.integer((0:4) ^ 2),
                                   seq(-5L, -1L, 1L)),
                                ncol = 3))

colProds(dm_matrix)

rowProds(dm_matrix)

```

colQuantiles	<i>Estimates quantiles for each row (column) in a matrix</i>
--------------	--

Description

Estimates quantiles for each row (column) in a matrix.

Usage

```
colQuantiles(x, rows = NULL, cols = NULL, probs = seq(from = 0, to = 1, by
  = 0.25), na.rm = FALSE, type = 7L, ..., drop = TRUE)
```

```
rowQuantiles(x, rows = NULL, cols = NULL, probs = seq(from = 0, to = 1, by
  = 0.25), na.rm = FALSE, type = 7L, ..., drop = TRUE)
```

```
## S4 method for signature 'DelayedMatrix'
colQuantiles(x, rows = NULL, cols = NULL,
  probs = seq(from = 0, to = 1, by = 0.25), na.rm = FALSE, type = 7L,
  force_block_processing = FALSE, ..., drop = TRUE)
```

```
## S4 method for signature 'DelayedMatrix'
rowQuantiles(x, rows = NULL, cols = NULL,
  probs = seq(from = 0, to = 1, by = 0.25), na.rm = FALSE, type = 7L,
  force_block_processing = FALSE, ..., drop = TRUE)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
probs	A numeric vector of J probabilities in [0, 1].
na.rm	If TRUE , NAs are excluded first, otherwise not.
type	An integer specify the type of estimator. See quantile for more details.
...	Additional arguments passed to specific methods.
drop	If TRUE , singleton dimensions in the result are dropped, otherwise not.

force_block_processing

FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on `getOption("DelayedArray.block.size")`) columns (`colFoo()`) or rows (`rowFoo()`) into memory as an ordinary `base::array`.

Value

Returns a `numeric` $N \times J$ ($K \times J$) `matrix`, where N (K) is the number of rows (columns) for which the J quantiles are calculated.

See Also

[quantile](#).

Examples

```
# A DelayedMatrix with a 'data.frame' seed
dm_df <- DelayedArray(data.frame(C1 = rep(1L, 5),
                                C2 = as.integer((0:4) ^ 2),
                                C3 = seq(-5L, -1L, 1L)))

# colnames, if present, are preserved as rownames on output
colQuantiles(dm_df)

# Input has no rownames so output has no rownames
rowQuantiles(dm_df)
```

colRanks

Gets the rank of each row (column) of a matrix

Description

Gets the rank of each row (column) of a matrix.

Usage

```
colRanks(x, rows = NULL, cols = NULL, ties.method = c("max", "average",
  "min"), dim. = dim(x), preserveShape = FALSE, ...)

rowRanks(x, rows = NULL, cols = NULL, ties.method = c("max", "average",
  "min"), dim. = dim(x), ...)

## S4 method for signature 'DelayedMatrix'
colRanks(x, rows = NULL, cols = NULL,
  ties.method = c("max", "average", "min"), dim. = dim(x),
  preserveShape = FALSE, force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowRanks(x, rows = NULL, cols = NULL,
  ties.method = c("max", "average", "min"), dim. = dim(x),
  force_block_processing = FALSE, ...)
```

Arguments

<code>x</code>	A <code>NxK DelayedMatrix</code> .
<code>rows</code>	A <code>vector</code> indicating subset of rows (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>cols</code>	A <code>vector</code> indicating subset of rows (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>ties.method</code>	A <code>character</code> string specifying how ties are treated. For details, see below.
<code>dim.</code>	An <code>integer vector</code> of length two specifying the dimension of <code>x</code> , also when not a <code>matrix</code> .
<code>preserveShape</code>	A <code>logical</code> specifying whether the <code>matrix</code> returned should preserve the input shape of <code>x</code> , or not.
<code>...</code>	Additional arguments passed to specific methods.
<code>force_block_processing</code>	<code>FALSE</code> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <code>TRUE</code> (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary <code>base::array</code> .

Details

The row ranks of `x` are collected as `rows` of the result matrix.

The column ranks of `x` are collected as `rows` if `preserveShape = FALSE`, otherwise as `columns`.

The implementation is optimized for both speed and memory. To avoid coercing to `doubles` (and hence memory allocation), there is a unique implementation for `integer` matrices. It is more memory efficient to do `colRanks(x, preserveShape = TRUE)` than `t(colRanks(x, preserveShape = FALSE))`.

Any `names` of `x` are ignored and absent in the result.

Value

An `integer matrix` is returned. The `rowRanks()` function always returns an `NxK matrix`, where `N` (`K`) is the number of rows (columns) whose ranks are calculated.

The `colRanks()` function returns an `NxK matrix`, if `preserveShape = TRUE`, otherwise a `KxN matrix`.

%% The mode of the returned matrix is `integer`, except for %% `ties.method == "average"` when it is `double`.

Missing and non- values

These are ranked as `NA`, as with `na.last = "keep"` in the `rank()` function.

See Also

`rank()`. For developers, see also Section 'Utility functions' in 'Writing R Extensions manual', particularly the native functions `R_qsort_I()` and `R_qsort_int_I()`.

Examples

```
# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

colRanks(dm_Matrix)

rowRanks(dm_Matrix)
```

colSums2

*Calculates the sum for each row (column) in a matrix***Description**

Calculates the sum for each row (column) in a matrix.

Usage

```
colSums2(x, rows = NULL, cols = NULL, na.rm = FALSE, dim. = dim(x), ...)

rowSums2(x, rows = NULL, cols = NULL, na.rm = FALSE, dim. = dim(x), ...)

## S4 method for signature 'DelayedMatrix'
colSums2(x, rows = NULL, cols = NULL,
         na.rm = FALSE, dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'Matrix'
colSums2(x, rows = NULL, cols = NULL, na.rm = FALSE,
         dim. = dim(x), ...)

## S4 method for signature 'SolidRleArraySeed'
colSums2(x, rows = NULL, cols = NULL,
         na.rm = FALSE, dim. = dim(x), ...)

## S4 method for signature 'DelayedMatrix'
rowSums2(x, rows = NULL, cols = NULL,
         na.rm = FALSE, dim. = dim(x), force_block_processing = FALSE, ...)

## S4 method for signature 'Matrix'
rowSums2(x, rows = NULL, cols = NULL, na.rm = FALSE,
         dim. = dim(x), ...)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.

na.rm If **TRUE**, **NA**s are excluded first, otherwise not.

dim. An **integer vector** of length two specifying the dimension of **x**, also when not a **matrix**.

... Additional arguments passed to specific methods.

force_block_processing FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to **TRUE** (typically not advised). The block-processing strategy loads one or more (depending on `getOption("DelayedArray.block.size")`) columns (`colFoo()`) or rows (`rowFoo()`) into memory as an ordinary `base::array`.

Details

The implementation of `rowSums2()` and `colSums2()` is optimized for both speed and memory.

Value

Returns a **numeric vector** of length **N (K)**.

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

colSums2(dm_matrix)

# NOTE: Temporarily use verbose output to demonstrate which method is
#       which method is being used
options(DelayedMatrixStats.verbose = TRUE)
# By default, this uses a seed-aware method for a DelayedMatrix with a
# 'SolidRleArraySeed' seed
rowSums2(dm_Matrix)
# Alternatively, can use the block-processing strategy
rowSums2(dm_Matrix, force_block_processing = TRUE)
options(DelayedMatrixStats.verbose = FALSE)
```

colTabulates

Tabulates the values in a matrix by row (column)

Description

Tabulates the values in a matrix by row (column).

Usage

```
colTabulates(x, rows = NULL, cols = NULL, values = NULL, ...)

rowTabulates(x, rows = NULL, cols = NULL, values = NULL, ...)

## S4 method for signature 'DelayedMatrix'
colTabulates(x, rows = NULL, cols = NULL,
  values = NULL, force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowTabulates(x, rows = NULL, cols = NULL,
  values = NULL, force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
values	An vector of J values of count. If NULL , all (unique) values are counted.
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Value

Returns a NxJ (KxJ) [matrix](#) where N (K) is the number of row (column) [vectors](#) tabulated and J is the number of values counted.

Examples

```
# A DelayedMatrix with a 'DataFrame' seed
dm_DF <- DelayedArray(S4Vectors::DataFrame(C1 = rep(1L, 5),
                                           C2 = as.integer((0:4) ^ 2),
                                           C3 = seq(-5L, -1L, 1L)))

colTabulates(dm_DF)

rowTabulates(dm_DF)
```

colVars	<i>Variance estimates for each row (column) in a matrix</i>
---------	---

Description

Variance estimates for each row (column) in a matrix.

Usage

```
colVars(x, rows = NULL, cols = NULL, na.rm = FALSE, center = NULL,
        dim. = dim(x), ...)
```

```
rowVars(x, rows = NULL, cols = NULL, na.rm = FALSE, center = NULL,
        dim. = dim(x), ...)
```

```
## S4 method for signature 'DelayedMatrix'
colVars(x, rows = NULL, cols = NULL,
        na.rm = FALSE, center = NULL, dim. = dim(x),
        force_block_processing = FALSE, ...)
```

```
## S4 method for signature 'DelayedMatrix'
rowVars(x, rows = NULL, cols = NULL,
        na.rm = FALSE, center = NULL, dim. = dim(x),
        force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
na.rm	If TRUE , missing values are excluded first, otherwise not.
center	(optional) The center, defaults to the row means.
dim.	An integer vector of length two specifying the dimension of x, also when not a matrix .
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Value

Returns a [numeric vector](#) of length N (K).

See Also

See rowMeans() and rowSums() in colSums().

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'HDF5ArraySeed' seed
# NOTE: Requires that the HDF5Array package is installed
library(HDF5Array)
dm_HDF5 <- writeHDF5Array(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

colVars(dm_matrix)

rowVars(dm_matrix)
```

colWeightedMads

Weighted Median Absolute Deviation (MAD)

Description

Computes a weighted MAD of a numeric vector.

Usage

```
colWeightedMads(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
               constant = 1.4826, center = NULL, ...)
```

```
rowWeightedMads(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
               constant = 1.4826, center = NULL, ...)
```

```
## S4 method for signature 'DelayedMatrix'
colWeightedMads(x, w = NULL, rows = NULL,
               cols = NULL, na.rm = FALSE, constant = 1.4826, center = NULL,
               force_block_processing = FALSE, ...)
```

```
## S4 method for signature 'DelayedMatrix'
rowWeightedMads(x, w = NULL, rows = NULL,
               cols = NULL, na.rm = FALSE, constant = 1.4826, center = NULL,
               force_block_processing = FALSE, ...)
```

Arguments

x A NxK [DelayedMatrix](#).

w	a vector of weights the same length as x giving the weights to use for each element of x. Negative weights are treated as zero weights. Default value is equal weight to all values.
rows	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
cols	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
na.rm	a logical value indicating whether <code>NA</code> values in x should be stripped before the computation proceeds, or not. If <code>NA</code> , no check at all for <code>NA</code> s is done. Default value is <code>NA</code> (for efficiency).
constant	A numeric scale factor, cf. mad .
center	Optional numeric scalar specifying the center location of the data. If <code>NULL</code> , it is estimated from data.
...	Additional arguments passed to specific methods.
force_block_processing	<code>FALSE</code> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <code>TRUE</code> (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary <code>base::array</code> .

Value

Returns a [numeric](#) scalar.

Missing values

Missing values are dropped at the very beginning, if argument `na.rm` is `TRUE`, otherwise not.

See Also

For the non-weighted MAD, see [mad](#). Internally [weightedMedian\(\)](#) is used to calculate the weighted median.

Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

colWeightedMads(dm_matrix, w = 1:5)

rowWeightedMads(dm_matrix, w = 3:1)
```

colWeightedMeans *Calculates the weighted means for each row (column) in a matrix*

Description

Calculates the weighted means for each row (column) in a matrix.

Usage

```
colWeightedMeans(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
  ...)

rowWeightedMeans(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
  ...)

## S4 method for signature 'DelayedMatrix'
colWeightedMeans(x, w = NULL, rows = NULL,
  cols = NULL, na.rm = FALSE, force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowWeightedMeans(x, w = NULL, rows = NULL,
  cols = NULL, na.rm = FALSE, force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
w	A numeric vector of length K (N).
rows	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
cols	A vector indicating subset of rows (and/or columns) to operate over. If NULL , no subsetting is done.
na.rm	If TRUE , missing values are excluded from the calculation, otherwise not.
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary base::array .

Details

The implementations of these methods are optimized for both speed and memory. If no weights are given, the corresponding `rowMeans()/colMeans()` is used.

Value

Returns a [numeric vector](#) of length N (K).

See Also

See `rowMeans()` and `colMeans()` in `colSums()` for non-weighted means. See also [weighted.mean](#).

Examples

```
# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                         as.integer((0:4) ^ 2),
                                         seq(-5L, -1L, 1L)),
                                         ncol = 3))

colWeightedMeans(dm_Matrix)
# Specifying weights inversely proportional to rowwise variances
colWeightedMeans(dm_Matrix, w = 1 / rowVars(dm_Matrix))
rowWeightedMeans(dm_Matrix, w = 1:3)
```

<code>colWeightedMedians</code>	<i>Calculates the weighted medians for each row (column) in a matrix</i>
---------------------------------	--

Description

Calculates the weighted medians for each row (column) in a matrix.

Usage

```
colWeightedMedians(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
  ...)

rowWeightedMedians(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
  ...)

## S4 method for signature 'DelayedMatrix'
colWeightedMedians(x, w = NULL, rows = NULL,
  cols = NULL, na.rm = FALSE, force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowWeightedMedians(x, w = NULL, rows = NULL,
  cols = NULL, na.rm = FALSE, force_block_processing = FALSE, ...)
```

Arguments

<code>x</code>	A $N \times K$ DelayedMatrix .
<code>w</code>	A numeric vector of length K (N).
<code>rows</code>	A vector indicating subset of rows (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>cols</code>	A vector indicating subset of rows (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>na.rm</code>	If <code>TRUE</code> , missing values are excluded from the calculation, otherwise not.
<code>...</code>	Additional arguments passed to specific methods.

force_block_processing

FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on `getOption("DelayedArray.block.size")`) columns (`colFoo()`) or rows (`rowFoo()`) into memory as an ordinary `base::array`.

Details

The implementations of these methods are optimized for both speed and memory. If no weights are given, the corresponding `rowMedians()`/`colMedians()` is used.

Value

Returns a **numeric vector** of length N (K).

See Also

Internally, `weightedMedian()` is used. See `rowMedians()` and `colMedians()` for non-weighted medians.

Examples

```
# A DelayedMatrix with a 'SolidRleArraySeed' seed
dm_Rle <- RleArray(Rle(c(rep(1L, 5),
                        as.integer((0:4) ^ 2),
                        seq(-5L, -1L, 1L))),
                  dim = c(5, 3))

# Specifying weights inversely proportional to rowwise MADs
colWeightedMedians(dm_Rle, w = 1 / rowMads(dm_Rle))
```

colWeightedSds

Weighted variance and weighted standard deviation

Description

Computes a weighted variance / standard deviation of a numeric vector or across rows or columns of a matrix.

Usage

```
colWeightedSds(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
              ...)

colWeightedVars(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
               ...)

rowWeightedSds(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
              ...)

rowWeightedVars(x, w = NULL, rows = NULL, cols = NULL, na.rm = FALSE,
               ...)
```

```
## S4 method for signature 'DelayedMatrix'
colWeightedSds(x, w = NULL, rows = NULL,
  cols = NULL, na.rm = FALSE, force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
colWeightedVars(x, w = NULL, rows = NULL,
  cols = NULL, na.rm = FALSE, force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowWeightedSds(x, w = NULL, rows = NULL,
  cols = NULL, na.rm = FALSE, force_block_processing = FALSE, ...)

## S4 method for signature 'DelayedMatrix'
rowWeightedVars(x, w = NULL, rows = NULL,
  cols = NULL, na.rm = FALSE, force_block_processing = FALSE, ...)
```

Arguments

x	A NxK DelayedMatrix .
w	a vector of weights the same length as x giving the weights to use for each element of x. Negative weights are treated as zero weights. Default value is equal weight to all values.
rows	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
cols	A vector indicating subset of elements (or rows and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
na.rm	a logical value indicating whether <code>NA</code> values in x should be stripped before the computation proceeds, or not. If <code>NA</code> , no check at all for <code>NA</code> s is done. Default value is <code>NA</code> (for efficiency).
...	Additional arguments passed to specific methods.
force_block_processing	<code>FALSE</code> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <code>TRUE</code> (typically not advised). The block-processing strategy loads one or more (depending on <code>getOption("DelayedArray.block.size")</code>) columns (<code>colFoo()</code>) or rows (<code>rowFoo()</code>) into memory as an ordinary <code>base::array</code> .

Details

The estimator used here is the same as the one used by the "unbiased" estimator of the **Hmisc** package. More specifically, `weightedVar(x, w = w) == Hmisc::wtd.var(x, weights = w)`,

Value

Returns a [numeric](#) scalar.

Missing values

Missing values are dropped at the very beginning, if argument `na.rm` is `TRUE`, otherwise not.

See Also

For the non-weighted variance, see [var](#).

Examples

```
# A DelayedMatrix with a 'SolidRleArraySeed' seed
dm_Rle <- RleArray(Rle(c(rep(1L, 5),
                        as.integer((0:4) ^ 2),
                        seq(-5L, -1L, 1L))),
                  dim = c(5, 3))

colWeightedSds(dm_Rle, w = 1 / rowMeans2(dm_Rle))

# Specifying weights inversely proportional to rowwise means
colWeightedVars(dm_Rle, w = 1 / rowMeans2(dm_Rle))

# Specifying weights inversely proportional to columnwise means
rowWeightedSds(dm_Rle, w = 1 / colMeans2(dm_Rle))

# Specifying weights inversely proportional to columnwise means
rowWeightedVars(dm_Rle, w = 1 / colMeans2(dm_Rle))
```

DelayedMatrixStats	<i>DelayedMatrixStats: Functions that apply to rows and columns of DelayedMatrix objects.</i>
--------------------	---

Description

DelayedMatrixStats is a part of the **matrixStats** API to work with *DelayedMatrix* objects from the **DelayedArray** package. High-performing functions operating on rows and columns of *DelayedMatrix* objects, e.g. `colMedians()` / `rowMedians()`, `colRanks()` / `rowRanks()`, and `colSds()` / `rowSds()`. Functions optimized per data type and for subsetted calculations such that both memory usage and processing time is minimized.

subset_by_Nindex	subset_by_Nindex
------------------	------------------

Description

`subset_by_Nindex()` is an internal generic function not aimed to be used directly by the user. It is basically an S4 generic for `DelayedArray:::subset_by_Nindex`.

Usage

```
subset_by_Nindex(x, Nindex)
```

Arguments

x	An array-like object.
Nindex	An unnamed list of subscripts as positive integer vectors, one vector per dimension in x. Empty and missing subscripts (represented by <code>integer(0)</code> and <code>NULL</code> list elements, respectively) are allowed. The subscripts can contain duplicated indices. They cannot contain NAs or non-positive values.

Details

`subset_by_Nindex(x, Nindex)` conceptually performs the operation `x[Nindex[1], ..., Nindex[length(Nindex)]]`. `subset_by_Nindex()` methods need to support empty and missing subscripts, e.g., `subset_by_Nindex(x, list(NULL, ...))` must return an $M \times 0$ object of class `class(x)` and `subset_by_Nindex(x, list(integer(0), integer(0)))` a 0×0 object of class `class(x)`.

Also, subscripts are allowed to contain duplicate indices so things like `subset_by_Nindex(x, list(c(1:3, 3:1), 2L))` need to be supported.

Value

A object of class `class(x)` of the appropriate type (e.g., integer, double, etc.). For example, if x is a [data.frame](#) representing an $M \times N$ matrix of integers, `subset_by_Nindex(x, list(NULL, 2L))` must return its 2nd column as a [data.frame](#) with M rows and 1 column of type integer.
