Package 'MesKit'

July 7, 2023

Type Package

Title A tool kit for dissecting cancer evolution from multi-region derived tumor biopsies via somatic alterations

Version 1.11.0

Description MesKit provides commonly used analysis and visualization modules based on mutational data generated by multi-region sequencing (MRS). This package allows to depict mutational profiles, measure heterogeneity within or between tumors from the same patient, track evolutionary dynamics, as well as characterize mutational patterns on different levels. Shiny application was also developed for a need of GUI-based analysis. As a handy tool, MesKit can facilitate the interpretation of tumor heterogeneity and the understanding of evolutionary relationship between regions in MRS study.

testNeutral *testNeutral*

Description

Evaluate whether a tumor follows neutral evolution or under strong selection during the growth based on variant frequency distribution (VAF) of subclonal mutations. The subclonal mutant allele frequencies of a follow a simple power-law distribution predicted by neutral growth.

Usage

```
testNeutral(
  maf,
  patient.id = NULL,
  withinTumor = FALSE,
  min.total.depth = 2,
  min.vaf = 0.1,
  max.vaf = 0.3,
  R2.threshold = 0.98,
  min.mut.count = 20,
  plot = TRUE,
  use.tumorSampleLabel = FALSE,
  ...
)
```

Arguments

maf	Maf or MafList object generated by readMaf function.
patient.id	Select the specific patients. Default NULL, all patients are included.
withinTumor	Test neutral within tumros in each patients. Default FALSE.
min.total.depth	The minimun total depth of coverage. Defalut 2
min.vaf	The minimum value of adjusted VAF value. Default 0.1
max.vaf	The maximum value of adjusted VAF value. Default 0.3

R2.threshold	The threshod of R2 to decide whether a tumor follows neutral evolution. Default 0.98
min.mut.count	The minimun number of subclonal mutations used to fit model. Default 20
plot	Logical, whether to print model fitting plot of each sample. Default TRUE.
use.tumorSampleLabel	Let Tumor_Sample_Barcode replace Tumor_Sample_Label if Tumor Label is provided in clinical data. Default FALSE.
...	Other options passed to subMaf

Value

the neutrality metrics and model fitting plots

triMatrix *triMatrix*

Description

Calculate the frequency of 96 trinucleotide mutation based on somatic SNVs.

Usage

```
triMatrix(phyloTree, patient.id = NULL, level = 2)
```

Arguments

phyloTree	phyloTree or phyloTreeList object generated by getPhyloTree function.
patient.id	Select the specific patients. Default NULL, all patients are included
level	Calculate the frequency of 96 trinucleotide mutatio on different levels. 1: patient-level, 2: tumor-level, 3: sample-level, 4: branch-level, 5: shared pattern (public/shared/private) of each tumor. 6: trunk/branch-level. Default 2.

Value

The frequency of 96 trinucleotide mutation.
